I Introduction to R-Studio

R-Studio is a family of powerful and cost-effective undelete and data recovery software. Empowered by new unique data recovery technologies, it is the most comprehensive data recovery solution for recovering files from [FAT/exFAT](#), NTFS, NTFS5, ReFS/ReFS2+ (Windows), HFS/HFS+ and APFS (Macintosh), Little and Big Endian variants of [UFS1/UFS2](#) (FreeBSD/OpenBSD/NetBSD/Solaris), [Ext2/3/4FS](#) and [XFS](#) (Linux) [partitions](#). It functions on local and network disks, even if such partitions are [formatted](#), damaged or deleted. Flexible parameter settings give you absolute control over the data recovery.

Mac OS X, OS X, and macOS are registered trademarks of Apple Inc.

All other trademarks are the property of their respective owners.

1.1 R-Studio Features

R-Studio is a family of file restoring utilities. It recovers files both on local drives and on drives on remote computers over network, even if their [partition](#) structures are damaged. A unique *IntelligentScan* technology and flexible parameter settings give you real control over the fastest data recovery ever seen.

R-Studio features:

- Standard "Windows Explorer" - style interface.
- Host OS: An Intel-compatible platform running Windows 11 /10 /8.1/8 /7 /Vista /XP /2000 Windows Server 2019 /2016 /2012 /2008 /2003.
- Automatic check for updates.
- Remotely recovers data over network. Data can be recovered on network computers running Windows, MacOS X, Linux, and some other UNIX OS.
- Supported [file systems](#):
 - Windows:** FAT12/16/32, [exFAT](#), NTFS, NTFS5, ReFS/ReFS2+ file (Resilient File System); ReFS for Windows Server 2019 (including deduplication).
 - macOS:** HFS, HFS+, HFSX, APFS, [FAT](#)/exFAT;

Linux and UNIX: [Ext2/3/4FS](#) and [XFS](#) (created by Linux or other OS), and [UFS1](#), [UFS2](#), [UFS BigEndian](#) (used by the FreeBSD, OpenBSD, and NetBSD operating systems);

CD/DVD/Images: ISO9660;

Magnetic tape devices: UStar/Tar/CPIO/Pax (**R-Studio Technician/T80+**).

Please note, that when a file is being deleted on the HFS, HFS+, HFSX file systems, the computer completely removes all system information on it, and there is no way to recover the deleted file except by using the [Extra Search for Known File Types](#) option. Nevertheless, **R-Studio** is able to read existing files from HFS, HFS+, and HFSX disks.

- Support for [known file types](#). **R-Studio** searches for files with known typical features of their structures allowing the user to search for files on devices with unknown files systems, including an HD, CD, DVD, floppy disk, Compact Flash Card, USB drive, ZIP drive, Memory Sticks, and other removable media.
- [Scan process](#) visualization. While scanning an object, **R-Studio** graphically shows items that have been found, including files of known types, FAT and NTFS MFT records, boot records, etc.
- Mass file recovery support.
- Support for estimation of chances for successful recovery.
- Support for file recovery lists - lists of files that can be exported from **R-Studio**, manually edited, and then loaded back. Files from such lists will be automatically marked for recovery.
- APM, Basic and GPT support. **R-Studio** supports all three partition schemes used to define the low-level organization of data on drives [formatted](#) for use with Macintosh computers.
- [Dynamic disk](#) support.
- Support for [BitLocker Drive Encryption](#) encryption, both for the ToGo and System Drive Encryption methods.
- Software RAID, volume set, and stripe set support. Support for RAID 6, RAID 5, and RAID 4 layouts. Support for custom RAID layouts. Parameters like block size and order, offsets, and even the number of stripe blocks can be explicitly specified. Custom RAID configurations can be saved.
- Support for [Windows Storage Spaces](#), created by Windows 8/8.1 and Windows 10/Threshold 2/? Anniversary/Fall Creators updates.
- Support for [Apple software RAIDs](#)
- Support for [Apple CoreStorage/FileVault/Fusion Drive Volumes](#)
- Support for [Linux mdadm Volumes](#)
- Support for [Linux LVM/LVM2](#)
- Support for Intel Software RAID.
- Hardware RAID, volume set, and stripe set support.
- RAID consistency check (check for valid data parity values).
- Automatic RAID parameter recognition.
- Creates [image](#) files for an entire drive, [logical](#) disk, or its part. Such image files can be processed like regular drives. In addition to simple exact object copies (Plain images) and [R-Drive Image](#) compatible images, it can create other disk image and virtual disk formats, together with opening several file formats "read-only". You may read more about those formats and their properties on the [Supported Virtual Disk and Disk Image Formats](#) page. Images may be saved either on the local or remote computer. Image creation can be stopped and then resumed. **R-Studio** can scan objects while creating their images. **R-Studio Technician/T80+** supports [multi-pass](#) and [runtime](#) imaging. Images can be mounted in the operating system as devices which makes their content accessible to any program including any other data recovery software.
- Recovers files on damaged or deleted partitions.

- Recovers compressed files (NTFS, NTFS5).
- Recovers encrypted files (NTFS5).
- Recovers [alternative data streams](#) (NTFS, NTFS5).
- Support for NTFS deduplication, including Windows Server 2022.
- Support for file system journal on the HFS+ and Ext3/4fs file systems.
- Support for soft updates journal on the UFS file system.
- Support for extended attributes on the HFS+, Ext3/4fs, XFS, and UFS file systems.
- Support for compressed files on the HFS+ file system.
- Recognizes localized names.
- Recovered files can be saved on any (including network) drives visible to the host operating system.
- A hexadecimal disk and file viewer/editor supporting NTFS file non-resident attribute editing. Data alteration is available on the **Technician/T80+** and **Corporate** versions only.
- Patterns (or templates) in the hexadecimal editor allowing for parsing the data according to specific data structure. Such patterns may be custom-created.
- File preview. Most of the file types can be previewed to estimate recovery chances.
- Enhanced remote host scanning procedure. In the **R-Studio** network versions, data is analyzed on the remote host rather than on the home host, thereby the speed of recovery procedure greatly increases. The scan information may be saved either on the local or remote computer.
- Recovered files may be saved on a drive on a connected remote computer rather than be transferred over network to the local one. Saving recovered files on a remote computer may be useful when the remote computer has a healthy drive because you do not have to transfer files over network. It may be an external USB drive, for example.
- Support for [S.M.A.R.T.](#) (Self-Monitoring, Analysis and Reporting Technology) attribute monitoring.
- **R-Studio Emergency***. The **R-Studio Emergency** version starts from a floppy or compact disc when it is necessary to recover data on a computer, on which Windows cannot start up because its system files are corrupted or deleted.

*The **R-Studio Emergency** is a part of the **R-Studio** software package. When you buy an **R-Studio** single license you may run the **R-Studio Emergency** or/and install the **R-Studio** Windows version on one PC only and you may not transfer the licensed software to another PC.

R-Studio features available in the Technician/T80+ versions:

- Magnetic tape devices file system: **UStar/Tar/CPIO/Pax**.
- [Extended file information](#)
- [Symbolic link recovery options](#)
- [Drive Copy Wizard](#) to copy any object in the Drives panel to any other object. In addition to byte to byte copy of any object visible in the Drives panel, smart copy of partitions and drives is available.
- [Mounting Virtual Objects to the System as Virtual Drives](#)
- [I/O Monitor and Sector Map files](#).
- [Multi-pass](#) and [Runtime](#) imaging
- [Reverse RAID](#)s: A technique that decomposes real drive objects into virtual RAIDs. Then those components of reverse RAID scan be processed like real objects. They can be viewed, edited, imaged, copied to physical
- Support for [third-party hardware](#).
- [Forensic mode](#).

- [File recovery over Internet](#).

R-Studio recovers files:

- That have been removed without the **Recycle Bin**, or when the **Recycle Bin** has been emptied;
- Removed by virus attack or power failure;
- After the partition with the files was reformatted, even for a different file system;
- When the partition structure on a drive was changed or damaged. In this case, **R-Studio** can scan the drive trying to find previously existed partitions and recover files from found partitions.
- From drives with [bad sectors](#). In this case, **R-Studio** can first copy the entire drives or its part into an image file and then process such image file.

R-Studio can create image files for an entire drive, logical disk, or its part. Such image files can be processed like regular drives. Images are very useful if there is a risk of total data loss due to hardware malfunction. If bad blocks are constantly appearing on a drive, the only way to save the data is to immediately create an image of that drive. All data search, scan and recovery can be done from this image.

To learn more about the *IntelligentScan* technology, go to the [IntelligentScan](#) topic .

1.2 System Requirements

- An Intel-compatible platform running Windows 11, 10 /8.1/8 /7 /Vista /XP /2000 Windows Server 2022, 2019 /2016 /2012 /2008 /2003
- At least 256 MB of RAM, a mouse, and enough disk space for recovered files, image files, etc.
- The administrative privileges are required to install and run R-Studio utilities.
- A network connection for data recovering over network.

1.3 Contact Information and Technical Support

To obtain the latest version of **R-Studio**, go to:

Product Site: <http://www.r-tt.com>

Sales Department: sales@r-tt.com

R-Studio Technical Support Team is available 24 hours a day, seven days a week, and has an average response time less than 4 hours.

Tech. Support: support@r-tt.com

Send your support request to: <http://www.r-tt.com/SupportRequest.shtml>

File Recovery FAQ: http://www.r-tt.com/File_Recovery_FAQ.shtml

R-tt Forum: <http://forum.r-tt.com>

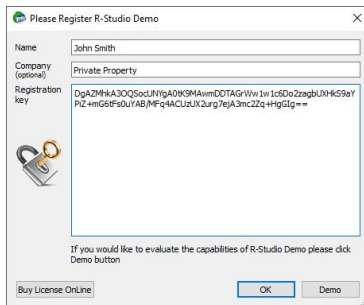

1.4 R-Studio Registration and Activation

R-Studio Standalone, Corporation, and T80+ requires on-line activation via the Internet. **R-Studio Standalone** and **Corporation** require activation one time upon their installation. **R-Studio T80+** requires activation every time a new data recovery session starts.

If you don't have an Internet connection on the computer where **R-Studio** to be installed, you'll need to complete activation manually.

- 1 **Upon receiving the email with the Registration key, open the attachment, then select and copy the key.**
- 2 **Start R-Studio. The Please Register R-Studio Demo dialog box will appear.**
- 3 **Enter your registration information and then paste the Registration key. Do not try to type it manually.**

Please Register **dialog box**

- 3 **Click the OK button and wait for the Registration successful message.**

If you don't have an Internet connection.

You need to manually obtain an activation code to complete the registration.

The Online Activation dialog window will appear next time you'll start **R-Studio**.

R-Studio Online Activation **dialog box**

You may copy the url with the activation information and go to it on another computer connected to the Internet, obtain the activation code, and enter it into the respective field on the dialog box.

You may also use your smartphone to activate **R-Studio**. Scan the QR-code and go to the specified URL, obtain the activation code, and finish program activation.

1.5 R-Studio Main Panel

When **R-Studio** starts, its main panel appears on the Windows desktop.

R-Studio Main panel

The screenshot shows the R-Studio Technician - Device view window. The main panel is divided into two sections: a table of devices/disks and a properties panel on the right.

Device/Disk	Label	FS/Interface	Start	Size

Refresh Copy All

Critical: This state indicates that the drive conditions are critical and chances of hardware failure are great. The best recommendation for this case is to stop working with the drive and bring it to professional data recovery specialists. You may though continue to work with the drive at your own risk, but [drive imaging](#) is very strongly recommended.

ID	Attribute Name	Current	Worst	Threshold	Raw Values

When a drive is selected in the **R-Studio** main panel, an additional S.M.A.R.T. tab will appear. You may view the detailed **S.M.A.R.T.** data of the drive.

S.M.A.R.T. (Self-Monitoring, Analysis and Reporting Technology) is a technology widely-used in drives and solid-state devices that monitors their reliability conditions to predict possible hardware failures.

Changing the program language

You may select the language of **R-Studio** main panel and its help. To do so, select an available language on **Change Language** on the **Help** menu.

Panel view options

You may set which panels and bars to enable/disable.

To enable/disable:

Toolbar	Select/clear Toolbar on the View menu
Status bar	Select/clear Status bar on the View menu
Drive pane	Select/clear Device View on the View menu
Properties pane	Select/clear Properties View on the View menu
Log panel	Select/clear Event Log on the View menu
If you have several tabs in the right pane, you may easily switch to any of the tab by selecting on the View menu	
Properties Tab	to view the Properties tab
Scan Information Tab	to view the Scan Information Tab tab
Parents Tab	to view the Parents tab
Properties	Select data types in which the data will be represented

**Connect**

Click this button to connect to a remote computer on a network.

**Refresh**

Click this button to refresh the panels.

**Scan**

Click this button to start scanning a selected object.

**Partition Search**

Click this button to start [fast searching for lost and deleted partitions](#).

**Show Files**

Click this button to start enumerating files on a selected object.

**Open Image**

Click this button to open a previously created image.

**Create Image**

Click this button to create an image of a selected area.

**Create Region**

Click this button to create a region on a selected disk.

**RAIDs**

Click this button to create a virtual volume set or RAID.

Select an appropriate type from the menu.

**Start runtime image**

Click this button to start [runtime imaging](#) of the selected object.

(**Technician/T80+** versions only)

**Remove**

Click this button to remove a selected object in the main panel.

The button may change its appearance and title depending on the context.

**Stop**

Click this button to stop the current operation.

Sometimes, there may be a lot of similar objects in the Drives panel. Those may be components of a RAID, for example. You may turn numerical indexes for such objects to distinguish them better. Those indexes will appear before the object names in the Drives panel.

To turn the numerical indexes on/off, go to the **Device** item on the **View** menu, and select/clear:

Show Physical Drives Indexes to display the indexes only for drives

Show All Objects Indexes to display the indexes for all objects in the Drives panel

Device/Disk	Label	FS/Interface	Start	Size

You may select the units in which object's start and size are displayed

To select the units

- 1 Select Devices on the View menu
- 2 Select the units in which you want to see object sizes.

You may select

Show as Bytes

Show as Sectors

Show as Bytes and Sectors

Depending on the task **R-Studio** performs, its panel may vary. Those panels are described in appropriate topics. The Properties tab names and values are described in detail on the [Properties tab](#) topic.

The general settings can be set on the [Settings](#) dialog box.

You may also copy the object's information displayed in the Drives panel. Right-click the object on the necessary column and select **Copy Device/disk**, **Copy Label**, and so on.

R-Studio has two operation modes:

File search on a [partition](#) (including recently found during [drive scan](#)).

In this mode, **R-Studio** analyzes MFTs on NTFS partitions, FATs on [FAT](#) partitions, and SuperBlocks on Ext2/3/4FS partitions. Then it displays all files which records have been found in the analyzed tables. Then recently deleted files, which records still remain, can be recovered. If files have not been found, that means that their records have been deleted. In this case, the drive must be scanned.

File search supports [file masks](#) and [regular expressions](#). Multiple files in different folders can be found and recovered in one recover session.

R-Studio supports [mass file recovery](#). There is no limit in the number of files that may be recovered during one session.

File content may be [previewed](#) before recovery.

File or drive binary data can be viewed and edited in the [Text/Hexadecimal editor](#). Also can be viewed and changed all attributes for NTFS files.

Drive scan, searching for partitions.

In this mode, **R-Studio** scans the entire drive or its part. Using a number of statistic and deterministic criteria known as *IntelligentScan* technology, it determines existing or existed partitions on the drive, and their [file systems](#). It is also possible to add new partitions, by setting manually all required parameters.

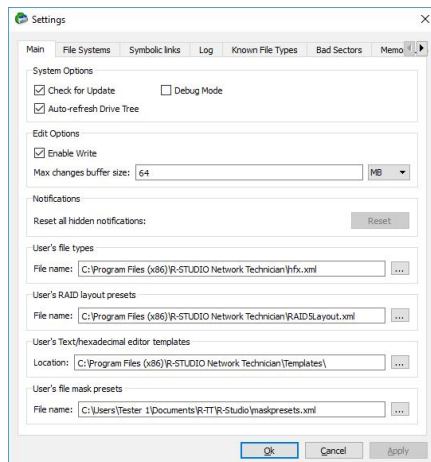

A drive can be scanned through several successive scans, each with its own parameters. **R-Studio** accumulates the information from successive scans and keeps track of changes in the information obtained from different scans. The information obtained from the disc scan can be stored in a file. It may be loaded and processed later at any convenient time.

1.6 R-Studio Settings

You may specify some global setting for **R-Studio** on the Settings dialog box. You may reach it by selecting **Settings** on the **Tools** menu.

Main

Main dialog box

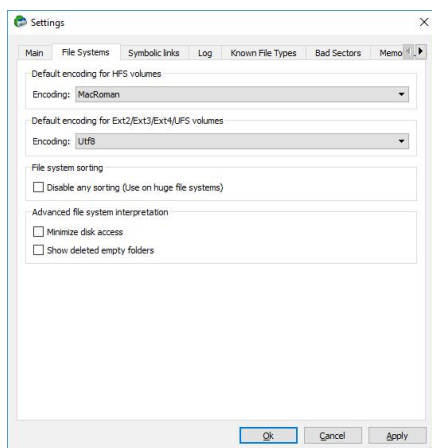

[-] Main settings

System Options	
Check for update	If this box is selected, R-Studio will automatically check for updates.
Debug Mode	If this check box is selected, R-Studio displays an additional command Create FS Snapshot on the shortcut menu for an object with a file system . An FS Snapshot contains system data for the file system only (file descriptions without file contents). If a problem appears, this snapshot can be sent to R-Studio technical support to identify the problem. This option greatly slows R-Studio .

Auto-refresh Drive Tree	If this box is selected, R-Studio automatically refreshes the list of connected drives. You may disable it if R-Studio experiences problems with connected devices.
Enable Write	If this check box is selected, R-Studio enables you to write any changes made in the Text/Hexadecimal editor .
Max changes buffer size	Maximum amount of data stored for the Undo command in the Text/Hexadecimal editor .
Notifications	
Reset all hidden notifications	This button enables all previously disabled notification and warning messages.
User's file types	
File name	Specifies a file name and path to the file where the descriptions of user's known file types are stored. You need to re-start R-Studio or click the Reload User's File Types button on the Known File Types tab for the new file to take effect.
User's RAID layout	
File name	Specifies a file name and path to the file where the descriptions of user's RAID layouts are stored
User's Text/Hexadecimal editor templates	
Location	Specifies the path for pattern description files for Text/Hexadecimal editor .
User's file mask presets	
File name:	Specifies a file name and path to the file with file mask presets.

File Systems

File Systems dialog box

File Systems

Default encoding for HFS volumes	Select the national encoding for the HFS partitions .
Default encoding for Ext2/Ext3/? Ext4/UFS volumes	Select the national encoding for the Ext2, Ext3, Ext4, and UFS partitions.

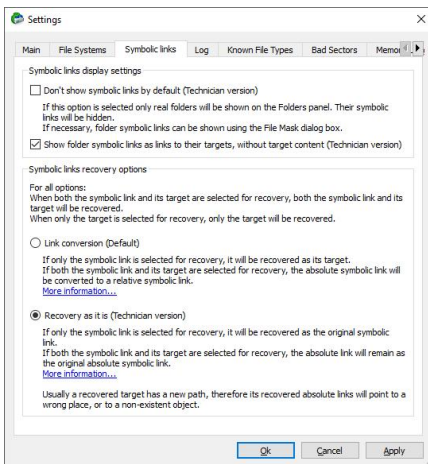

Disable any sorting	Select this option if the number of files on the drive is so large that R-Studio sorts files in selected folders for too long time.
Minimize drive access	Select this option if a lot of bad sectors are on the drive. R-Studio will reduce access to internal files in the file system to speed up the interpretation of file system data.
Show deleted empty folders	Select this option if you want to view empty deleted folders.

Symbolic Links

Settings are available in the Technician/T80+ version only!

[Symbolic links](#) (of symlinks for short) are object that contains references to other files or folders directory in the form of absolute or relative paths and that affect pathname resolution. For example, if a symlink `c:\ProgramData\Documents` points to `D:\Recovered Files\Root\Users\Public\Documents`, entering it will result in entering `D:\Recovered Files\Root\Users\Public\Documents`.

Symbolic Links dialog box

Symbolic Links

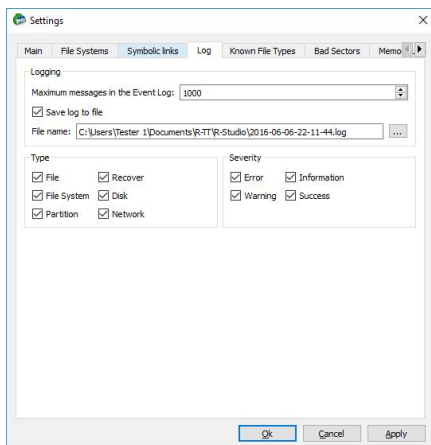

Don't show symbolic links by default (Technician/T80+ version)	If this option is selected, R-Studio hides all symbolic links by default. Only real objects will be visible. You may make them visible by clearing the Hide symbolic links option on the Mask dialog box.
Show symbolic links as links to their targets, without target content	Only links to their target will be shown in the right pane (Contents). They target content can be reached by clicking those links.
Link conversion (Default)	
Both an object and its symbolic link are selected for recovery:	If both an object and its symbolic link are selected for recovery, both the object and its symbolic link will be recovered. The file path in that symbolic link will be converted from absolute to relative. Example: If the object <code>C:\ProgramData\Documents</code> is a symbolic link to <code>C:\Users\Public\Documents</code> , it will be converted to a symbolic link to <code>..\Users\Public\Documents</code> . Therefore, the symbolic link will point to its object regardless of the place to which the object has been recovered.

Only an object is selected for recovery:	Only the selected object will be recovered.
Only a symbolic link is selected for recovery:	The selected symbolic link will be recovered as a real object.
Recovery as it is (Only in the Technician/T80+ version)	
Both an object and its symbolic link are selected for recovery:	<p>If both an object and its symbolic link are selected for recovery, both the object and its symbolic link will be recovered. The file path in that symbolic link will remain the same.</p> <p>Example: The place to store recovered data: D:\Recovered Files. The object to recover: C:\Users\Public\Documents The symbolic link: C:\ProgramData\Documents After recovery: The recovered object: D:\Recovered Files\Root\Users\Public\Documents The recovered symbolic link: D:\Recovered Files\Root\ProgramData\Documents pointing to C:\Users\Public\Documents. Therefore, if someone tries to enter to the symbolic link, the system will open the object C:\Users\Public\Documents, rather than recovered D:\Recovered Files\Root\Users\Public\Documents.</p>
Only an object is selected for recovery:	Only the selected object will be recovered.
Only a symbolic link is selected for recovery:	The symbolic link will be recovered as a symbolic link which may contain a path to a nonexistent object.

The [Data Recovery Topics](#) topic explains processing of symbolic links recovery in more detail.

Log

Log dialog box

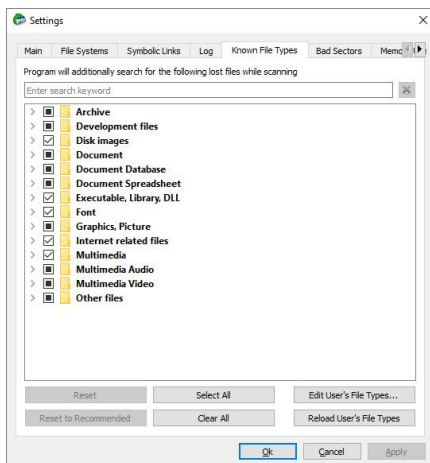

Log options

Logging	
---------	--

Maximum messages in the Event Log	Specifies the maximum number of messages R-Studio will keep in the event log
Save log to file	If this check box is selected, R-Studio writes its log into a log file specified in the File name field.
File name	Specifies the file name in which the log will be saved.
Type	
File	If this check box is selected, R-Studio logs all events with recovered files.
File System	If this check box is selected, R-Studio logs all events with the file system.
Partition	If this check box selected, R-Studio logs all events with partitions.
Recover	If this check box is selected, R-Studio logs all events with the recovering processes.
Drive	If this check box is selected, R-Studio logs all events with drives.
Network	If this check box is selected, R-Studio logs all events with network operation.
Severity	
Error	If this check box is selected, R-Studio adds error messages into its log.
Warning	If this check box is selected, R-Studio adds warning messages into its log.
Information	If this check box is selected, R-Studio adds information messages into its log.
Success	If this check box is selected, R-Studio adds success messages into its log.
NEVER WRITE A LOG FILE ON THE DISK FROM WHICH YOU RECOVER DATA!!! Or you may obtain unpredictable results and lose all your data.	
Note: If in the Recover dialog box the Condense successful restoration events check box is selected, the Log will display only Error, Warning, and Information event messages.	

Known File Types

Known File Types dialog box

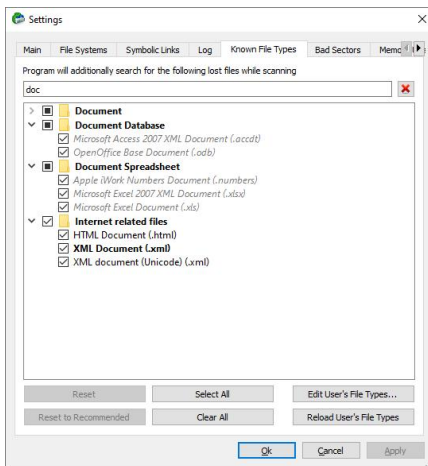

You may specify which [Known File Types](#) will be enabled/disabled by default. You may also specify know file types to search for during a specific [scan session](#) on the [Scan](#) dialog box.

Known File Types

Reset	Click this button to reset the settings to the previous state. Active until the Apply button is clicked.
Select All	Click this button to select all file types in the list.
Clear All	Click this button to clear all file types in the list except some predefined ones.
Reload User's File Types	Click this button to apply new file types after the user's file types file has been changes from the Main tab.
Edit User's File Types	Click this button to add a new customer's Known File Type, or to edit already existing ones. See the Customizing File Types help page for more details.

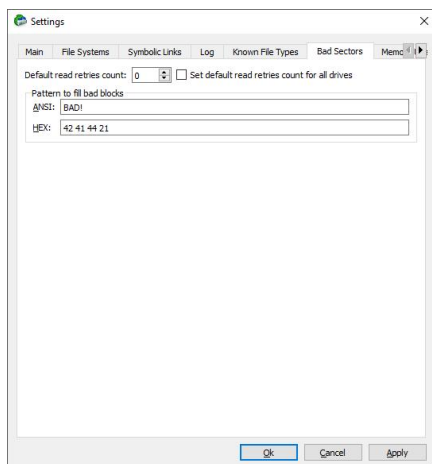

You may search for required file types if necessary

Search for the doc pattern

Bad Sectors

Bad Sectors dialog box

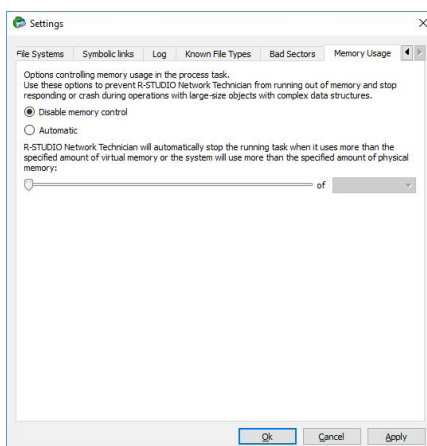

▣ **Bad Sectors settings**

Default read retries count	<p>Specifies a default value for I/O Tries, or how many times R-Studio will try to read a bad sector. You may specify this parameter for each drive separately on the Properties tab.</p> <p>R-Studio treats bad sectors in the following way: It reads a certain part of drive (predefined by Windows) and</p> <ul style="list-style-type: none"> • If Default read attempts is set to 0, the entire part with bad sectors will be filled with the specified pattern. • If Default read attempts is set to a non-zero value, R-Studio reads again that part sector by sector, repeating the attempts the specified number of times. If R-Studio still cannot read a bad sector, it fills the sectors with the specified pattern. In this case only the bad sectors will be filled with the pattern, but that extremely slows the drive read process. <p>For example, if you set Default read retries count to 1, a bad sector will be read 2 times.</p>
Set default read retries count for all drives	Click this button to reset Default read retries count for all drives to the default value.
Pattern to fill bad blocks	<p>Specifies a default pattern R-Studio will use to fill bad sectors in files to recover, in images, or when showing data in the Text/Hexadecimal viewer/editor. You may specify the pattern either in the ANSI or Hex data format.</p> <p>Note: R-Studio will never ever try to write anything on the drive from which data is to recover or an image is to create.</p>

Memory Usage

Memory Usage dialog box

These settings control how much memory **R-Studio** uses for its work. They help preventing **R-Studio** from locking when trying to perform very memory-consuming tasks like scanning large drives or processing file systems with a lot of files.

▣ **Memory Usage settings**

Disable memory control	If this option is selected, the memory control is disabled.
------------------------	---

Automatic	If this option is selected, R-Studio will automatically stop performing the task when the amount of used memory reaches the specified value. You may specify the limit for either the virtual or physical memory.
-----------	--

You may see how much memory **R-Studio** actually uses on the [Memory Usage](#) dialog box.

II Data Recovery Using R-Studio

Many specific data recovery cases are discussed in the R-Tools' [Data Recovery Guide](#).

Depending on the situation, data recovery may vary:

1. Recovery of deleted files that have resided on an existing logical disk

This can be done using [Basic File Recovery](#).

2. Recovery of files that have resided on a data disk with a damaged file system, or on a previously deleted or re-formatted partition

If the file system on such [logical disk](#) is damaged, the operating system sees that logical disk as a [partition](#) without a valid [file system](#). Such partition should be previously [scanned](#). Also, it should be scanned if you want to recover data on a previously deleted or [reformatted](#) partition.

You may use [Fast Search for Lost](#) partitions if you want only to find partitions previously existed on the drive. It's much faster.

When the partition is scanned, a number of recognized partitions will appear. **R-Studio** shows them in different colors depending on which elements of the partition have been found.

 F:	An existing logical disk or partition
 F: (Recognized12)	An existing logical disk or partition after drive scan
 Recognized18	A recognized partition. Both boot records and file entries are found for this partition
 Recognized22	A recognized partition. Only file entries are found for this partition
 Recognized16	A recognized partition. Only boot records are found for this partition
 Recognized8	A fast found partition
 Empty Space21	Empty space on the object
 DeletedPart1	A deleted partition
 Raw Files	Files that have been found using scan for known file types (raw file search).

Although such recognized partitions are virtual objects, files can be searched for and recovered from recognized partitions as from real logical disks using [Basic File Recovery](#).

To successfully recover files from a recognized partition, it is necessary to find a right one which corresponds to the real logical disk on which the files resided. No strict rules can be applied to that, but the following considerations should be taken into account:

- If you are going to recover files from a **drive with a damaged file system**, most likely the right recognized partition will be a green one.
- If you are going to recover files from a **previously deleted** or **re-formatted partition**, most likely the right recognized partition will be a yellow one.

Also always check the recognized partition's file system, start point, and size. They should be the same for the recognized partition and real logical disk/partition. When in doubt, try to [preview](#) a couple of files from the recognized partition. If the files are seen correctly, this is the right partition.

3. Data recovery from a damaged [system disk](#). The computer does not start up.

- If this computer is on a network, create an [R-Studio Agent Emergency](#) startup disk for the computer, install **R-Studio** on another computer on the network, and recover data [over network](#).
- If this computer is stand-alone, create an [R-Studio Emergency](#) startup disk and use it to start up the computer and recover data. You may use external USB drives to store recovered files.

[R-Studio Features](#)

[Contact Information and Technical Support](#)

[R-Studio Emergency](#)

[R-Studio Agent Emergency](#)

2.1 Basic File Recovery

NEVER TRY TO SAVE RECOVERED FILES/FOLDERS TO THE SAME LOGICAL DISK WHERE THEY RESIDE!!!

Or you may obtain unpredictable results and lose all of your data.

See the [Data Recovery Issues](#) topic for details.

Basic file recovery can be made for deleted files that has resided on an existing [logical disk](#) visible to the operating system. In all other cases, [Advanced Data Recovery](#) is required.

To recover deleted files from a logical disk (recognized partition),

1 Double-click a logical disk in the R-Studio's Drives panel to enumerate files on the disk

Other ways to enumerate files

- Select the disk and click the **Open Drive Files** button,
or
- Right-click the selected disk and select **Open Drive Files** on the shortcut menu,
or
- Select the disk and press the **F5** key.
or
- Select **Open Drive Files** on the **Drive** menu

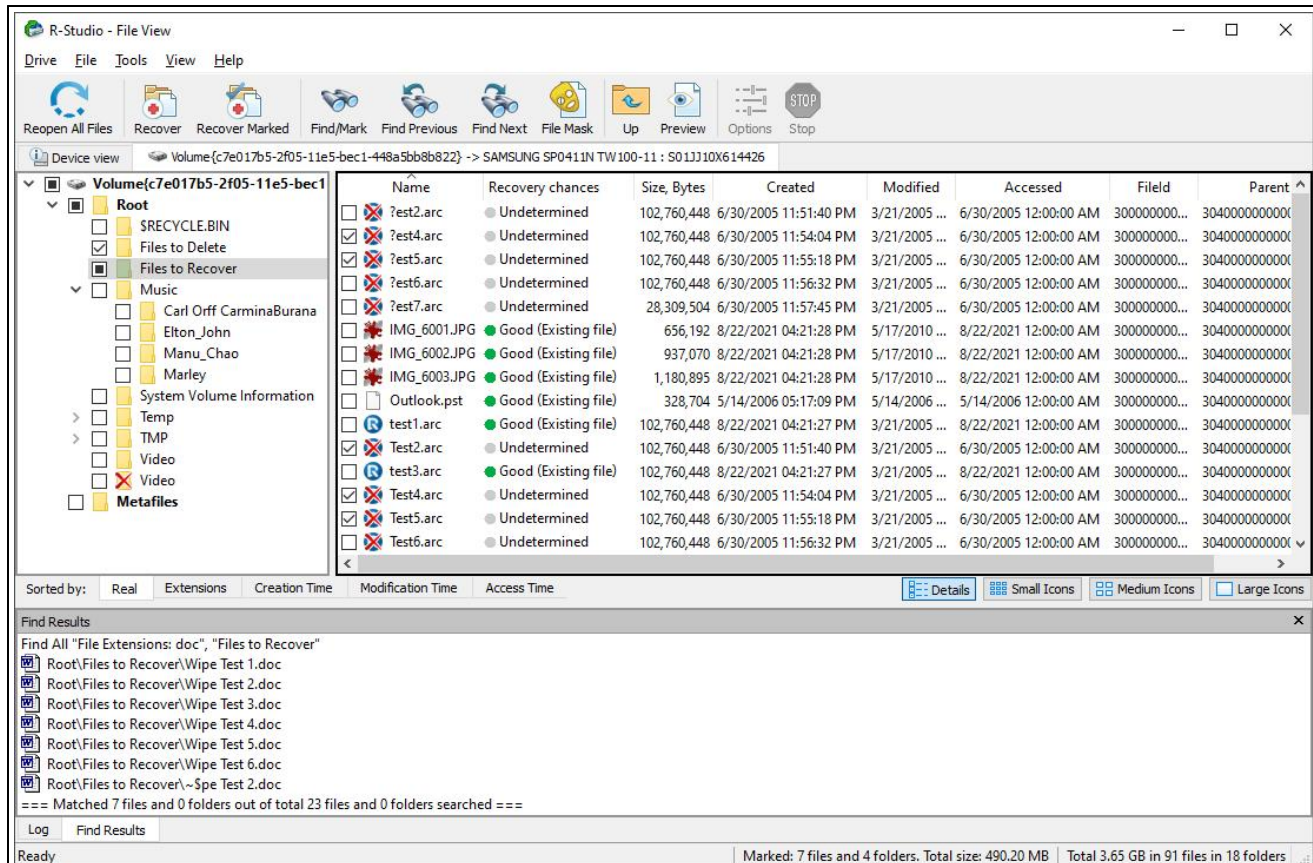

If you try to enumerate files on a drive or another object without a valid file system on it, a Double-click a logical disk... message will appear. Select a logical disk on the object or [scan](#) the object.

> **R-Studio will change its panel showing the disk's folders/files structure**

R-Studio analyzes data on the object and displays all files for which records have been found in the analyzed tables. If files have not been found, that means that their records have been deleted. To find such files, [Advanced Data Recovery](#) is required.

Please note that **R-Studio** shows only those files/folders that match a specified [file mask](#).

R-Studio Main panel

Panel view options

You may set which panels and bars to enable/disable. To enable/disable

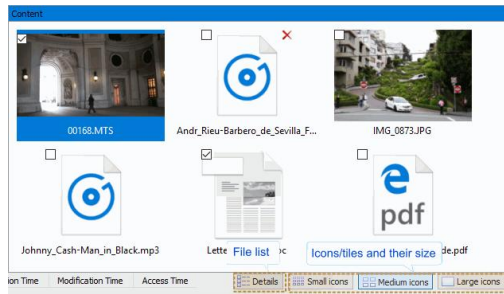

The Toolbar	Select/Unselect Toolbar on the View menu
The Status bar	Select/Unselect Status bar on the View menu
The Folders panel	Select/Unselect Folders View on the View menu
The Files panel	Select/Unselect Contents View on the View menu
The Log panel	Select/Unselect Event Log on the View menu
The Find Results panel	Select/Unselect Find Results on the View menu

You may also arrange the data as required. On the **View** menu, select **Arrange** and then a required arrangement.

You may specify which columns will be visible in the Files panel. On the **View** menu, select **Contents Columns**, and select the columns you want to see.

Files can be shown as a list or as icons/files of different sizes.

Files shown as icons/files

Recovery chances

R-Studio shows its estimates of chances for successful file recovery in the **Rec** column.

Recovery chances

	Undefined
	Good
	Above average
	Average
	Below average
	Bad

When **R-Studio** has enumerated files, those estimates may not be accurate and aren't available for most files. You may improved them by right-clicking the root folder on the left pane, selecting **Recheck Recovery Chances** on the shortcut menu, and specifying required parameters.

The best estimations are though after scanning the disk/partition.

File Information

You may view some information about a file. Right-click the file and select **Get Info** on the context menu.

File Information

R-Studio Technician/T80+ shows much more information about a file. See the [Information about a File](#) topic for more details.

Select Drive

Click this button to return to the **R-Studio** main panel to select another drive.

Reopen Drive Files

Click this button to list files again.

Reopen Drive Files

Recover

Click this button to recover selected folders/files.

Recover Marked

Click this button to recover marked folders/files.

Find

Click this button to find or/and mark a particular file/folder.

Find Next

Click this button to find the next object specified in the **Find/Mark** dialog box

Find Previous

Click this button to find the previous object specified in the **Find/Mark** dialog box.

File Mask

Click this button to specify a file mask.

The **Unmask** button appears when a mask is applied.

Click this button to remove the applied mask.

Up
Click this button to move highlighting one folder up.

Options
Click this button to change Recovery Options.

Stop
Click this button to stop the current operation.

The Log panel will show how many files and folders are on the object, and their size. You may specify which events will be shown in the log pane by setting a [log filter](#).

Note: Metafiles are the file system's internal files invisible to any user, or file system data, which **R-Studio** represents as files. These files do not contain user data directly. Unless you want to scrutinize a disk file system, do not restore them.

If the Too many files... message appears, you may temporarily stop file listing and browse through found files. Then you can resume file listing. You also may skip this file topic and continue. **R-Studio** will keep information about the entire file structure.

You may also copy the information about folders and files.

▣ For the folder (the Folders pane):

Click Copy Folder :	To copy the folder's name
Click Copy Path :	To copy the path to the folder

▣ For the file (the Contents pane):

Click Copy (Column Name) :	To copy the file's Name , Size , Created , etc., depending on which column is selected
Click Copy Path :	To copy the file path.
Click Copy Selected Text :	To copy all the columns of the selected file.

Symbolic Link processing

R-Studio recognizes [symlinks](#) and processes them as specified in the [R-Studio Settings](#) panel. Go to the [Data Recovery Issues](#) topic for details.

You may open several disks/[partitions](#) in one tab. Read the [Opening several disks/partitions in one tab](#) help page for more details.

2 Select a file/folder to recover

You may select several files/folders in the same parent folder by pressing the **Shift** button and clicking the objects simultaneously.

☐ **Marking multiple files/folders from different parent folders manually:**

Mark a file/folder to recover by clicking the box left to the object, or select **Mark** on the shortcut menu. You may mark several files/folders in different parent folders. You may mark all objects in the folder by selecting **Mark All** on the **Tools** or shortcut menu. To unmark an object, click the box left to the object once more or select **Unmark** on the shortcut menu. You may unmark all objects in the folder by selecting **Unmark All** on the **Tools** or shortcut menu.

The Log panel will show how many files and folders you have marked, and their total size.

R-Studio can search for a particular file. Go to the [Searching for a File](#) topic for details. If you need to find and mark many files, go to the [Find and Mark Multiple Files](#) topic for details.

File content may be previewed before recovery. Go to the [Previewing Files](#) topic for details.

If you do not find files that you want to recover:

Sometimes **R-Studio** can find the files but not the entire file paths to them. It puts such files into the **Extra Found Files** folder. Try to search for the files there. If that does not help, try to find them by using file search globally on the entire drive. Go to the [Searching for a File](#) topic for details

If you still cannot find files that you want to recover but are sure they have existed on the logical disk, you need to use [Advanced Data Recovery](#) to find them.

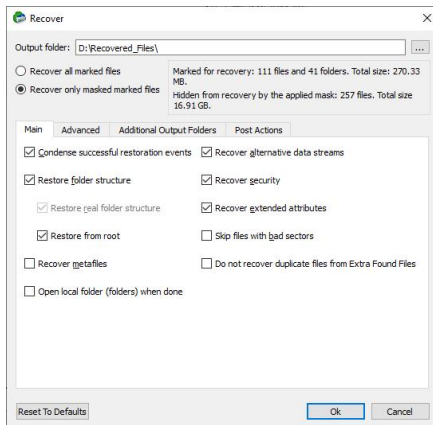

3 Click the Recover or Recover Marked button

☐ **Other ways to recover selected files**

- Right-click the selected file/folder and select **Recover** or **Recover Marked** on the shortcut menu, or
- Select **Recover** or **Recover Marked** on the **File** menu or
- Press the **F2** button.

4 Specify recover options and output folder on the Recover dialog box and click the OK button

Recover dialog box

Recover (Advanced) dialog box

If you have another computer connected to **R-Studio** over network, the Recover dialog box will be slightly different. See [Data recovery over network](#) for details.

Recover options

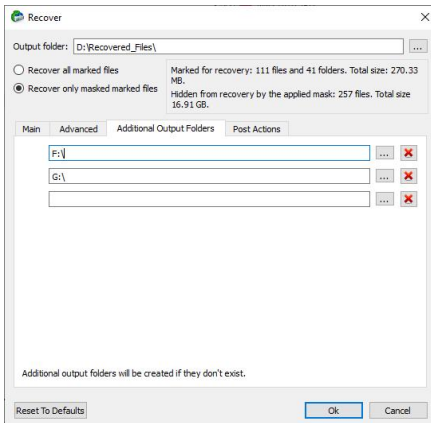

Recover all marked files	All files, regardless of the applied mask, will be recovered.
Recovered only masked marked files	Only files matching the applied mask will be recovered.
Condense successful restoration events	If this check box is selected, R-Studio will display only error and warning messages in its Log
Restore folder structure	If this check box is selected, R-Studio recovers the entire path to the selected object.
Restore from root	If this check box is selected, R-Studio recovers the entire path to the selected object starting from the root folder of the disk.
Recover metafiles	If this check box is selected, R-Studio recovers disk metafiles. Metafiles are the file system's internal files invisible to any user, or file system data, which R-Studio represents as files. These files do not contain user data directly. Unless you want to scrutinize a disk file system, do not restore them.
Recover alternative data streams	If this check box is selected, R-Studio recovers alternative data streams for file systems that support them. Has no effect on FAT files. See Extended Information Recovery for the NTFS file system, and Data Recovery on HFS/HFS+ File System for the Mac computers.
Recover security	If this check box is selected, R-Studio recovers security attributes for NTFS files. Has no effect on FAT files. See Extended Information Recovery for details.
Recover extended attributes	If this check box is selected, R-Studio recovers extended file attributes in the file system.
Recover real folders structure	Enabled when the files are sorted by their extensions or date. See Find and Mark Multiple Files for details. If this check box is selected, R-Studio recovers the real folders/files structure on the disk rather than that of sorted files.

Skip files with bad sectors	If this check box is selected, R-Studio skips files with bad sectors and displays their list on the Files with bad sectors dialog box when the recovery has been completed. You may separately decide later what to do with those files. See Bad sectors for details. If this check box is cleared, R-Studio tries to read those sectors several times (specified on the Settings/Bad Sectors dialog box), and, if fails, fills bad sectors in the recovered file with the pattern specified on the same box. Information about such files will appear in the Log .
Do not recover duplicate files from Extra Found Files	If this check box is selected, R-Studio does not recover files from Extra Found Files (raw files) that are duplicates of the files found in file system (Root).
Ignore file mask	If this check box is selected, R-Studio recovers all content of a selected folder, ignoring a specified File Mask .
Open local folder (folders) when done	If this check box is selected, the folder with recovered files will be opened upon recovery completion.
Advanced	Specifies options for mass file recovery

If you want to recover multiple files at once, go to the [Recover Multiple Files](#) for more information.

R-Studio Technician/T80+

Recover (Additional Output Folders) dialog box

Additional Output Folders

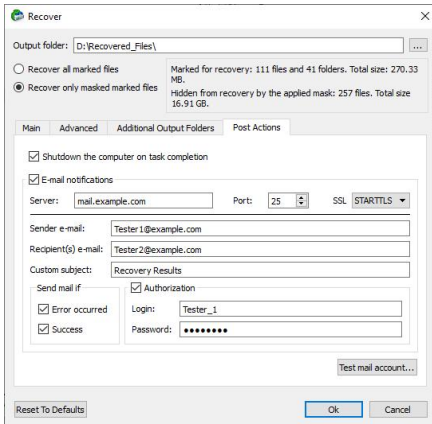

Additional Output Folders

Additional output folders where recovered files will be stored when **R-Studio** runs out of space.

NEVER TRY TO SAVE RECOVERED FILES/FOLDERS TO THE SAME LOGICAL DISK WHERE THEY RESIDE!!!

Or you may obtain unpredictable results and lose all of your data.

Recover (Post Actions) dialog box

Post Actions Options

Shutdown the computer on task completion	If this check box is selected, R-Studio will shut down your computer when file recovery has been completed. The program will warn you if any option on the Advanced tab is set to Prompt.
E-Mail notifications	If this check box is selected, R-Studio will inform you about the outcome of the operation via email.

If a file to be recovered appears to have an invalid name, a Broken File Name dialog box will appear. You may correct the name and resume file recovery.

Broken File Name dialog box

Broken File Name properties

File name	Shows the current incorrect file name.
New name	Field for a new file name.
Edit broken symbols only	If this check box is selected, only invalid symbols may be corrected
Change all invalid symbols to	If this check box is selected, all invalid symbols will be changed to the specified symbol
Buttons	
Rename	Click to resume file recovery
Rename All	Click to resume file recovery. All other files will be renamed according to the specified rule.

Skip	Click to skip this file
Skip All	Click to skip all files and stop file recovery

If there is no space available for the recovered files, the There is not enough space on the disk dialog box will appear. You may either select other place to store the files, skip that particular file or abort the recovery process.

There is not enough space on the disk **dialog box**

- > **R-Studio will recover the selected/marked files/folders to the specified folder and show the results in the Log pane**

The Recovery progress indicator will show the log and progress of recovery process.

Recovery progress indicator

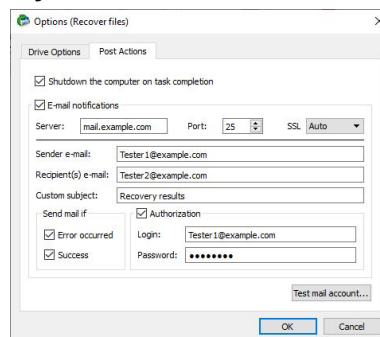

You may change some options during the process of file recovery and see [I/O Monitor](#) to inspect the process of drive input/output operations in real time

You may change some options during the process of file recovery

Only in the Technician version

Note: R-Studio recovers files from Ext2/3/4FS partitions, but writes it to FAT or NTFS local disks. Or you may write such files to network drives. **R-Studio** successfully recovers files from Ext2/3/4FS partitions

except its security attributes. **R-Studio** recovers [symlinks](#) as files containing the path to files which *symlinks* point to.

See [Data Recovery on HFS/HFS+ file system](#) for details on recovering data from disks with the HFS/HFS+ file system

[File Masks](#)

[Regular Expressions](#)

[Event Log](#)

2.1.1 Opening several disks/partitions in one tab

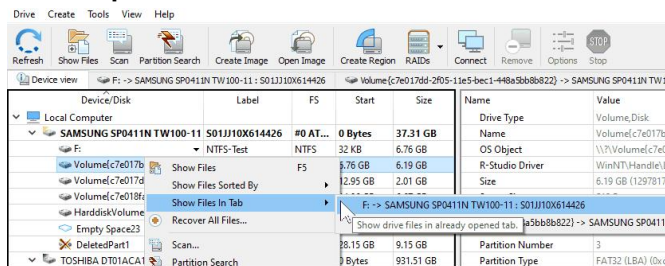

You may open several [disks/partitions](#) in one tab. Then you may search for files and recover them from several disks/partitions at once. This is especially useful if files are to be recovered from several recognized partitions found on one real disk/partition or a drive.

To open several disks/partitions in one tab,

- 1 Open one partition in a usual way (double-click a logical disk, for example).
- 2 Right-click the next partition, select **Show Files In Tab**, and select the tab you want the partition appear in, or

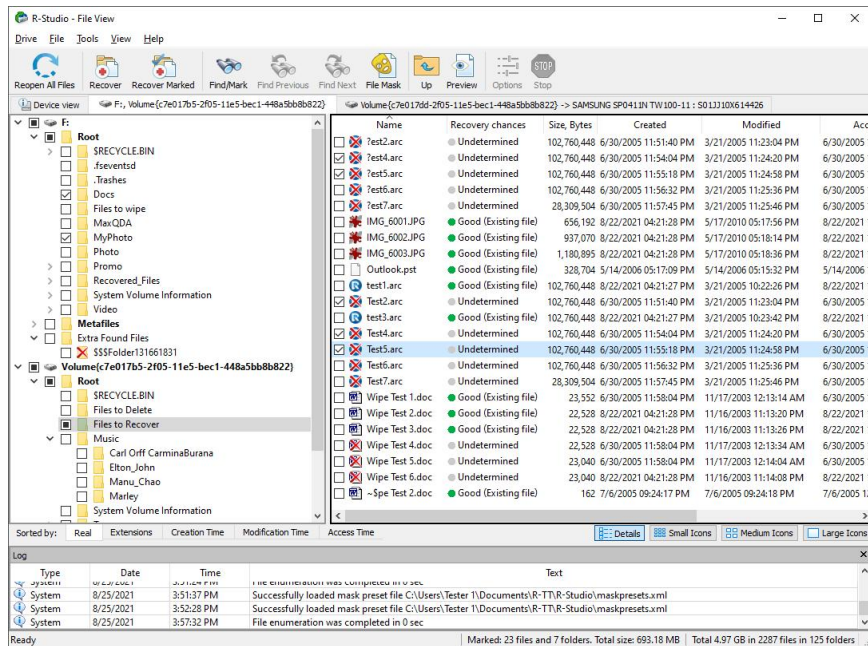

drag the disk/partition from the Device view to the required tab.

Several partitions in one tab

> R-Studio will show files from several partitions in one tab

Several partitions in one tab

Now files may be searched for, marked for recovery, and recovered.

To remove a disk/partition from the tab,

- 1 Right-click the required disk/partition in the tab and select Close drive in the shortcut menu.

Several partitions in one tab

> R-Studio will remove the selected disk/partition from the tab

2.1.2 Searching for a File

R-Studio can find a particular file, if it is difficult to find it manually in the Folders or Files panel. You can also automatically mark/unmark all found files.

To search for a file,

- 1 Click the Find button

Other ways to search for the file

- Right-click a folder and select **Find** on the shortcut menu,

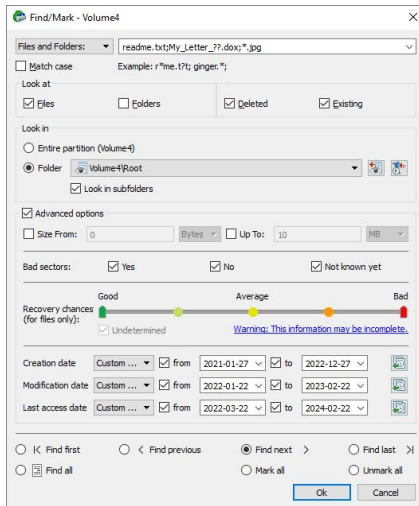

OR

- Select a folder and select **Find** on the **Tools** menu

2 Specify a file to be found and its options on the Find dialog box, and click the OK button

Note that a [File Mask](#) may be applied.

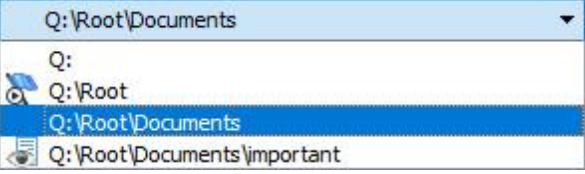

Find/Mark (Main) dialog box

Find/Mark options

You may specify how to treat specified strings. Please note that **R-Studio** stores previously entered search strings.

All Files and Folders	If this option is selected, R-Studio applies Advanced Options to all files.
File Extensions	If this option is selected, R-Studio treats specified strings as file extensions
Files and Folders	If this option is selected, R-Studio treats specified strings as file names. Use ? for one unspecified character and * for an unlimited number of them to specify file masks.
Regular Expressions	If this option is selected, R-Studio treats specified strings as regular expressions
File Id	Specifies File Id that R-Studio assigns to a file.
Match case	If this check box is selected, R-Studio makes a case-sensitive search
Look at	
Files	If this check box is selected, R-Studio includes files into a search.
Folders	If this check box is selected, R-Studio includes folders into a search. Disables when the Mark/Unmark All option is selected.
Deleted files	If this check box is selected, R-Studio makes a search among deleted files/folders.
Existing files	If this check box is selected, R-Studio makes a search among existing files/folders.
Look in	Specifies where R-Studio searches for, and marks, files. It can look for them on the Entire partition, or in/from a certain folder. If several partitions are opened in one tab, the places will be: All opened partitions, Selected partition, or in/from a certain folder. You may specify the starting folder for the search.

	 <p>  identifies current opened folder.  identifies current starting folder for the search.  sets starting folder to the current opened folder.  sets back current starting folder. </p>
Advanced options	If this check box is selected, R-Studio will use the advanced options.
Size from/up to	Specifies file size limits. See the Data Formats and Multipliers topic for more details on data formats.
Bad sectors	Specifies whether there are bad sectors in the files. Not known: it's unclear if there are bad sectors in the files.
Runtime image	Specifies whether the files have already been included into the runtime image .
Recovery Chances	Specifies files with certain recovery chances.
Date	Specifies file date boundaries. Dates for Modified, Created, and Last Accessed timestamps may be set separately.
	The Set for all button sets the specified data for all fields.
Find/Mark options	<p>Specify what R-Studio does with the found files.</p> <p>The Find first/previous/next/last options. R-Studio stops at the first/previous/next/last file that matches the specified search criteria.</p> <p>Find all files. R-Studio searches for all files that matches the specified search criteria..</p> <p>The search results appear in the Find Results panel.</p> <p>Mark/Unmark All. R-Studio marks/unmarks all files that match the search criteria. When these options are selected, R-Studio marks/unmarks files only, not folders, regardless of what Look at: Folders specifies.</p> <p>Please note, that when performing a new find and mark/unmark task, R-Studio does not takes into consideration the previous marked/unmarked state of files. For example, if you first mark all doc files, and then all txt files, all doc files remain marked, too. To unmark them, you should specify doc once again and select Unmark files.</p>
Find/mark objects only in real paths, ignore links to folders	If this check box is selected, links to folders will be treated as real folders: they will appear among search results or marked objects.

> **R-Studio will show/mark the found file(s)**

If you need to find and mark many files, go to the [Find and Mark Multiple Files](#) topic for details.

To repeat the search,

- * Click the **Find Next** or **Find Previous** buttons

Other ways to repeat the search

- Right-click a folder and select **Find Next** or **Find Previous** on the shortcut menu
or
- Select a folder and select **Find Next** or **Find Previous** on the **Tools** menu

To find all files and show them in the Find Results panel,

- * Select **Find all** on the on the Find dialog box,

or

select **Find all** on the **Tools** menu

- > **R-Studio will show the found files in the Find Results panel**

You may do the following actions on the found files:

Recover, Mark, Preview

by right-clicking the found file and selecting the appropriate item in the shortcut menu.

2.1.3 Finding Previous File Versions

R-Studio can find previous versions of files. It searches for them in the file's current folder and in **Extra Found Files**.

File versions are searched for using file size. If the size of a files is within 10% of the original filesize, the following conditions are checked:

Conditions	Legend
File name	N
File extension	E
Recognized file type	T

To search for previous file versions,

- 1 Right-click the file and select **Find Previous Versions of the File** on the shortcut menu

- * **R-Studio will show the files in the list:**

File versions

This technique can be used to find deleted original files after attacks of file encrypting viruses.

2.1.4 Previewing Files

R-Studio has a built-in file previewer that allows you to preview both existing and deleted files. You may use this feature to estimate chances for successful file recovery or to find a file to recover.

While previewing a file in the external viewer, you may recover it or mark the file for recovery using Previewer buttons.

Previewer buttons

Mark for recovery, Previous file, Next file, Recover

To preview a file

1 Right-click a file to preview in the Files panel and select Preview on the shortcut menu

Other ways to preview the file

- Select the file in the Files panel and click the **Preview** button,
- OR
- Select the file in the Files panel and select **Preview** on the **File** menu

> R-Studio will show the content of the file

If you have several files open in the previewer, you may instantly close all of them by selecting **Close All Previews** on the **File** menu.

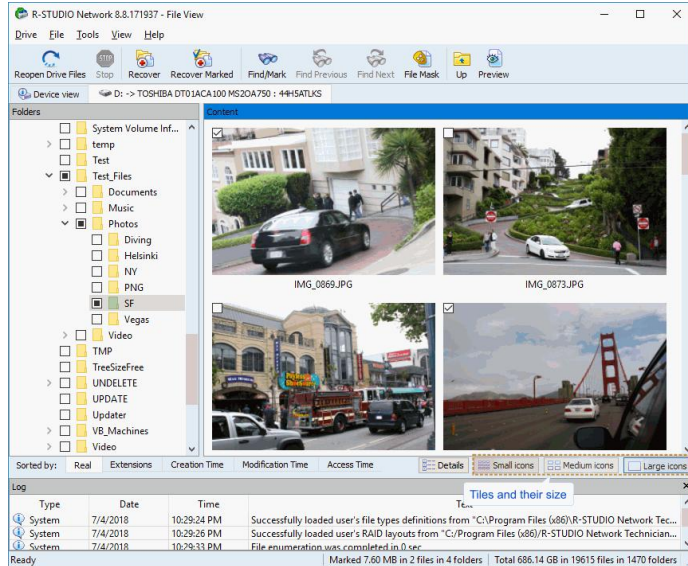

File Previewer for Pictures:

Pictures can be previewed either as tiles within the main window of **R-Studio** or in an external previewer.

Within the main window as tiles:

Tile size can be changed..

Pictures as tiles

In the external viewer:

Picture files can be zoomed in/out and rotated.

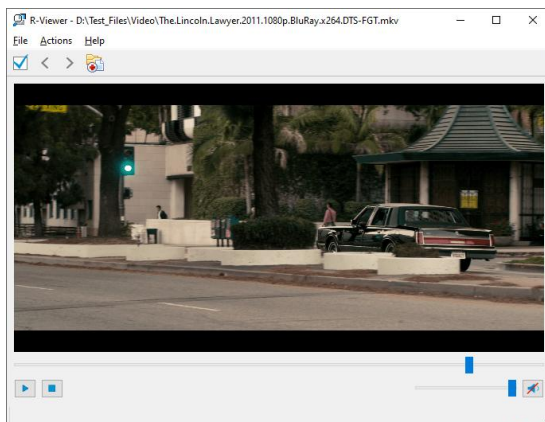

Picture file previewer

File Previewer for Video and Audio files:

Video and audio files can be played even without their respective application installed.

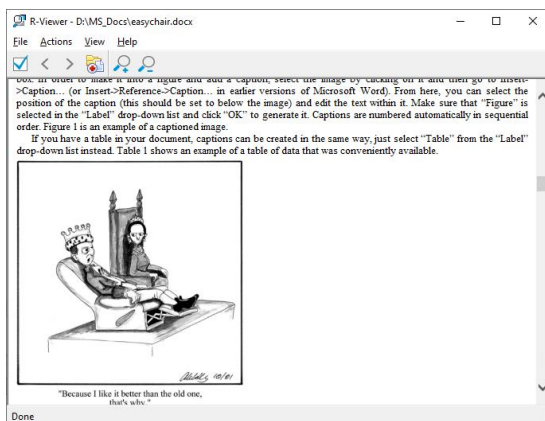

Video file previewer

File Previewer for Microsoft/Open/Libre Office Documents:

Documents can be shown (including embedded pictures) even without their respective applications installed. They can be zoomed in/out for better viewing.

Microsoft/Open/Libre Office document previewer

File Previewer for Adobe Acrobat PDF Files:

Files can be shown even without Adobe Acrobat installed.

The previewer allows the users to jump to a required page, zoom the document, and search for a required text.

Adobe Acrobat pdf document previewer

Supported File Types:

Documents:

MS Office and Open/Libre Office files, even without the programs installed:

- Word/Writer documents: docx;
- Excel/Calc spreadsheets: xlsx;
- PowerPoint presentation: pptx.

Office 97-2003, without the program installed:

- Word documents: doc;
- Excel spreadsheets xls;
- PowerPoint presentation ppt.

Adobe Acrobat document: pdf.

2.1.5 File Masks

R-Studio shows only those files/folders that match the specified file mask. File mask affects files/folders that are processed by the **Recover** and **Find** commands.

To specify a file mask,

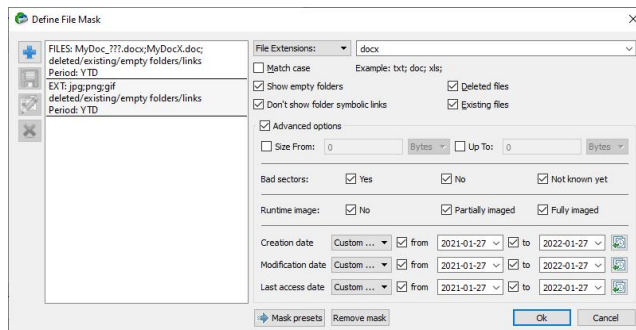

1 Click the File Mask button

Other ways to specify the file mask

- Right-click a folder and select **File Mask** on the shortcut menu
- OR
- Select the folder and select **File Mask** on the **Tools** menu

2 Specify the file mask on the File mask dialog box and click the OK button

Mask dialog box

File mask options

You may specify options for All Files, File Extensions, Files, and Regular Expressions	
Match case	If this check box is selected, R-Studio makes a case-sensitive search.
Show empty folders	If this check box is selected, R-Studio will show folders with no files in them.
Deleted files	If this check box is selected, R-Studio makes a search among deleted files/folders.
Existing files	If this check box is selected, R-Studio makes a search among existing files/folders.
Hide symbolic links	If this check box is selected, R-Studio hides all symbolic links . It may be selected by default if the Don't show symbolic links by default option is selected on the Settings dialog box.
Use advanced options	If this check box is selected, R-Studio will use the advanced options, even when they are hidden.
Advanced Options	
Size from/up to	Specifies file size limits. See the Data Formats and Multipliers topic for more details on data formats.

Bad sectors	Specifies whether there are bad sectors in the files. Not known: it's unclear if there are bad sectors in the files.
Runtime image	Specifies whether the files have already been included into the runtime image.
Date	Specifies file date boundaries. Dates for Modified, Created, and Last Accessed timestamps may be set separately.
	The Set for all button sets the specified data for all fields.

> **R-Studio will show only those files that match the specified file masks**

Click the **Unmask** button to remove the applied mask.

Mask presets

You may set various presets with different file masks. Just click on the Plus button to add the data from the dialog box to the presets. You may also give presets names, delete them, and store them permanently.

2.1.6 Regular Expressions

Regular expression is a notation for patterns of text, as opposed to exact strings of characters. The notation uses literal characters and metacharacters. Every character which does not have special meaning in the regular-expression syntax is a literal character and matches an occurrence of that character. For example, letters and numbers are literal characters. A metacharacter is a symbol with special meaning (an operator or delimiter) in the regular-expression syntax.

.	Wildcard: any character
*	Repeat: zero or more occurrences of previous character or class
^	Line position: beginning of line
\$	Line position: end of line
[class]	Character class: any character in the set
[^class]	Inverse class: any character not in the set
[x-y]	Range: any characters within the specified range
\x	Escape: literal use of metacharacter x
\<xyz	Word position: beginning of the word
xyz\>	Word position: end of the word

For example, the following regular expression `.*` matches any string of characters, `^a` matches any string beginning with character a.

2.1.7 Event Log

R-Studio logs and displays events in the Log panel. You may set a **Log filter** to display only needed information and to write it to a log file. You may specify the log settings on the [Settings](#) dialog box.

You may clear or save the log

To clear the log,

- * **Right-click the Log panel and select Clear Log on the shortcut menu.**

To save the log to a file,

- * **Right-click the Log panel and select Save Log to File on the shortcut menu.**

You may copy data from separate messages:

Click **Copy (Column Name)**: To copy the record's Type, Date, Time, Text, depending on which column is selected

Click **Copy Selected Text**: To copy all the columns of the selected record.

2.2 Advanced Data Recovery

This chapter explains how to perform advanced data recovery operations.

- [Drive Scan](#)
- [Fast-Search-for-Lost-Partition](#)
- [Customizing File Types](#)
- [Customizing File Types-I](#)
- [Customizing File Types-II](#)
- [Regions](#)
- [Exclusive Regions](#)
- [Images](#)
- [Wiping Objects](#)

2.2.1 Drive Scan

In order to completely analyze data structure on an object, it must be scanned. Any object in the Drives panel can be [scanned](#). In addition, you may create a *region* to scan only a part of an object. The [Regions](#) topic explains how to create and work with *regions*. Scan is also greatly improves estimations for chances of successful file recovery.

You may select scan area and some other scan parameters. Scan information may be saved to a file and later this file may be opened.

You may save scan information on the remote computer if necessary.

Note: You may use [Fast Search for Lost partitions](#) if you want only to find partitions previously existed on the drive. It's much faster.

Attention: Scanning large areas may be a very lengthy process!

NEVER TRY TO SAVE SCAN INFORMATION TO THE OBJECT BEING SCANNED!!!

Or you may obtain unpredictable results and lose all of your data.

To scan an object

1 **Select an object in the R-Studio's Drives panel**

2 **Click the Scan button**

Other ways to start scan

- Right-click the selected drive and select **Scan** on the shortcut menu,
or
- Select **Scan** on the **Drive** menu

3 Specify the required parameters on the Scan dialog box and click the Scan button

Scan dialog box

Scan options

Drive Size:	Shows the size of the object to be scanned
Start:	Sets the start point of the area to be scanned.
Size:	Sets the size of the area to be scanned.
Numbers in these fields can be in bytes or sectors. See the Data Formats and Multipliers topic for more details on data formats.	
File Systems:	Specifies the file systems which objects are to be searched for. Current version supports: FAT , NTFS, exFAT , ReFS, Ext2/3/4FS , XFS , HFS, APFS, and UFS file systems. The Technician version supports also the ISO9660 file system. Please note that if you need to scan an HFS, HFS+, or HFSX disk, always enable the Extra search for Known File Types option. This is very important because when files are being deleted on the HFS, HFS+, HFSX file systems, the computer completely removes all system information on them, and there is no way to recover the deleted files except by using the Extra Search for Known File Types option. See Data Recovery on HFS/HFS+ file system for details.
Extra search for Known File Types	Enables search for Known File Types.
Save scan Info to File:	If this checkbox is selected, R-Studio will save scan information to a specified file. Later this file may be opened. Please note, that this option does not save actual drive data, only information on drive data structure gathered during drive scan. If
Simple view	If this option is selected, R-Studio will show only scan progress.
Detailed view	If this option is selected, R-Studio will show graphic representation on objects found during scan.
None	If this option is selected, R-Studio will not show the Scan Information tab during scan.
Buttons	
Scan	Starts scanning
Advanced	Activates advanced scan options
Known File Types...	Selects file types that R-Studio will recognize during the drive scan.

Cancel	Closes the dialog box
--------	-----------------------

NEVER TRY TO SAVE SCAN INFORMATION TO THE OBJECT BEING SCANNED!!! Or you may obtain unpredictable results and lose all of your data.

If a remote computer is connected for [Data Recovery over Network](#), the Scan dialog box will have a different look

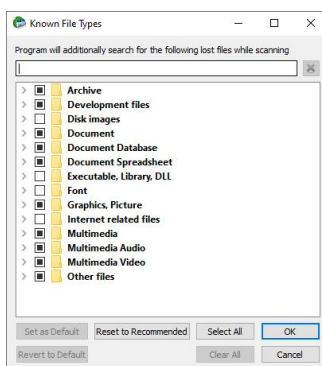

and the Save Scan Information File dialog box will appear when you select a place to store scan info. You may save it to the local or remote computer.

Known File Types (raw file search): While scanning, **R-Studio** can recognize the data's particular file type. Using such information, **R-Studio** can obtain more information about data/file structure on the object being scanned. By default, **R-Studio** tries to recognize the default list of supported file types specified on the Known File Types tab of the [Settings](#) panel, greatly increasing time required for the scan. You may reduce it by selecting only those file types that you need. Click the **Known File Types...** button and select the required file types on the File Types dialog box. These selections will be applied to that scan session only.

R-Studio places such found files in the Raw Files section in the the Drives panel.

File Types dialog box

Known File Types

Set as Default	Click this button to set the current list of selected file types as default values.
Revert to Default	Click this button to revert the default settings specified on the Known File Types tab of the Settings panel.
Reset to Recommended	Click this button to revert to factory-preset default settings.
Select All	Click this button to select all file types in the list.

Clear All

Click this button to clear all file types in the list except some predefined ones.

▣ **List of known file types**

Note: Using scan for Known File Types, **R-Studio** can successfully recover only un-fragmented files. You may also specify your own file types for scanning. See [Customizing File Types](#) for details. User-defined file types precede over built-in ones, if their definitions overlap. You may set the defaults for known file types on the [R-Studio Settings](#).

R-Studio Technician/T80+

Scan (Post Actions) dialog box

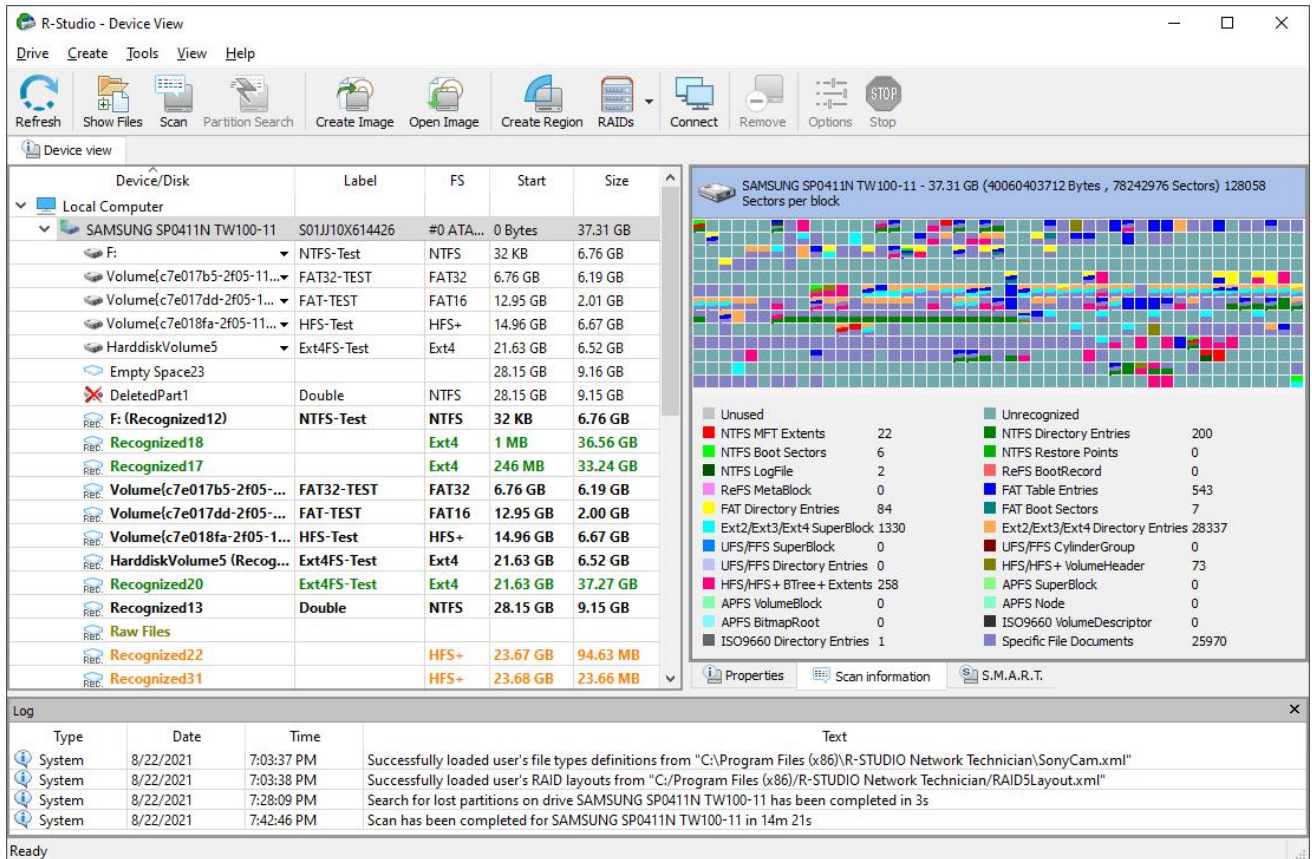

Post Actions Options

Shutdown the computer on task completion	If this check box is selected, R-Studio will shut down your computer when scan has been completed. You should select the Save to file checkbox and specify a place to save scan info to activate this option.
E-Mail notifications	If this check box is selected, R-Studio will inform you about the outcome of the operation via email.

> **R-Studio starts scanning the object, and its panel will show information about new found objects:**

R-Studio Main panel

Drives panel after scanning:
You can select an object by clicking it

System	8/22/2021	7:03:37 PM	Successfully loaded user's file types definitions from "C:\Program Files (x86)\R-STUDIO Network Technician\SonyCam.xml"
System	8/22/2021	7:03:38 PM	Successfully loaded user's RAID layouts from "C:\Program Files (x86)\R-STUDIO Network Technician\RAIDSLayout.xml"
System	8/22/2021	7:28:09 PM	Search for lost partitions on drive SAMSUNG SP0411N TW100-11 has been completed in 3s
System	8/22/2021	7:42:46 PM	Scan has been completed for SAMSUNG SP0411N TW100-11 in 14m 21s

The Log pane will show scan progress. Scan may be stopped by clicking the **Stop** button on the toolbar. Later the scan process may be resumed with different scan parameters. Some scan parameters may also be changed during the scan process. Click the Options button and change them on the Scanning dialog box. You may change some options during the scan process

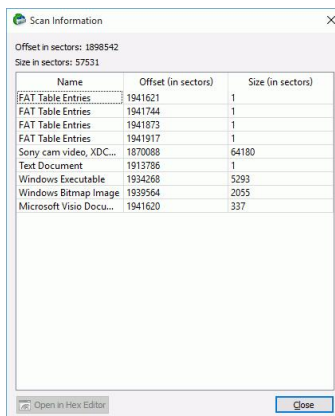

Only in the Technician version

You may see which file object(s) is/are on a particular drive part. Click the corresponding rectangle in the Scan Information pane and view the information on the Scan Information dialog box.

Scan Information dialog box

Double-click an object to view/edit the file object in the [Text/Hexadecimal editor](#).

When an object is scanned, a number of Recognized partitions will appear. **R-Studio** shows them in different colors depending on which elements of the partition have been found.

F:	An existing logical disk or partition
F: (Recognized12)	An existing logical disk or partition after drive scan
Recognized18	A recognized partition. Both boot records and file entries are found for this partition
Recognized22	A recognized partition. Only file entries are found for this partition
Recognized16	A recognized partition. Only boot records are found for this partition
Recognized8	A fast found partition

Empty Space21	Empty space on the object
DeletedPart1	A deleted partition
Raw Files	Files that have been found using scan for known file types (raw file search).

Although such recognized partitions are virtual objects, files can be searched for and recovered from recognized partitions as from real [logical disks](#) using [Basic File Recovery](#).

To see the information about a newly found object, simply click it in the Drives panel. Click this link to see the information about the object Recognized13 on the logical disk H:

Properties	Value
Name	Recognized13
Drive Type	Partition
Size	27.54 GB (57760039 Sectors)
Partition Offset	9.77 GB (20482937 Sectors)
Partition Size	27.54 GB (57760039 Sectors)
Recognized FS	
Parsed Boot Records	1
Parsed Directory Entries	96
Estimated Files Count	4104
Estimated Size	27.51 GB (57689352 Sectors)
NTFS Information	
Cluster Size	4 KB (8 Sectors)
MFT Record Size	1 KB
MFT Position	3 GB (6291456 Sectors)
MFT Mirror Position	13.75 GB (28844672 Sectors)

When an object in the scanned drive is selected, **R-Studio** shows the scanned area of the object.

Object's scanned area

The screenshot displays the R-Studio Technician interface. On the left, the 'Device view' pane shows a list of drives and partitions. The drive 'WDC WD1600BEVT-80A23TD 01.01.A01' is selected, showing a size of 149.05 GB. Below it, a list of partitions is shown, with 'E: (Recognized5)' selected as the 'Selected object'. This partition is NTFS, 1 MB in size, and has a scanned size of 39.09 GB. The main window shows a grid representing the scanned area of the selected object, with a blue box labeled 'Object's area' highlighting a specific region. A legend at the bottom right of the grid lists various file system components and their counts, such as 'Unused' (35), 'NTFS Directory Entries' (92), and 'NTFS Boot Sectors' (8). A log window at the bottom shows the scan completion message: 'Scan has been completed for WDC WD1600BEVT-80A23TD 01.01.A01 in 54m 49s'.

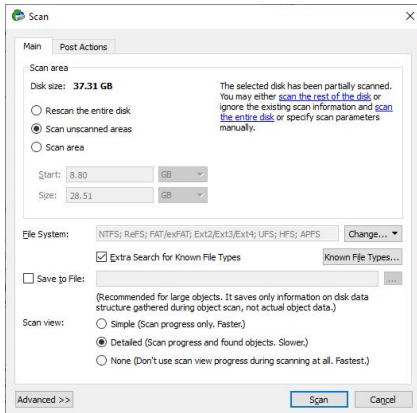

All scanned information may be deleted on the shortcut menu for a scanned object.

Scan information may be saved in a file. Previously saved scan information may be loaded. This can be done on the **Drive** or shortcut menu for a selected object.

Resuming incomplete scans or scanning the object with different parameters

You may resume the scan of an incompletely scanned object or rescan the already scanned object with different parameters. The Scan dialog will be a little bit different in this case.

Scan dialog box for incomplete scans

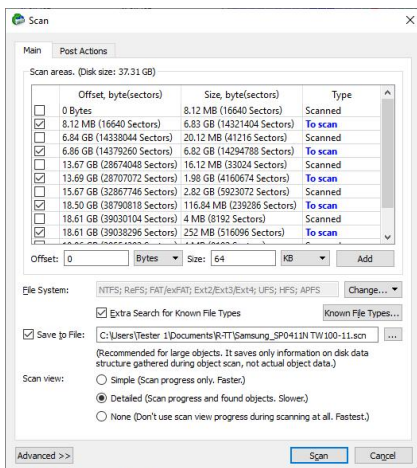

You may rescan the entire drive, scan unscanned areas, or scan an explicitly specified area.

Scan of multiple areas

You may simultaneously scan several successive or overlapping areas. Click the **Advanced** button, specify an offset and size for a new area to scan on the Advanced Scan dialog box and click the **Add** button. You may specify and add several scan areas. You may select which areas should be scanned. Selected scan areas can be merged. Right-click a necessary area and select either **Merge Down**, **Merge Down All**, and **Merge Selected**. You may also select/unselect unscanned areas.

Advanced Scan dialog box

R-Studio accumulates the information from successive scans and keeps track of changes in this information obtained from different scans.

You may manage the areas

Managing scan information

Scan information may be saved to a file. Previously saved scan information may be loaded.

To save scan information

- 1 Select an object in the **R-Studio Drives** panel
- 2 Select **Save Scan Information** on the **Drive** or shortcut menu and save the scan information in a file

The default file extension is `*.scn`.

If a remote computer is connected for [Data Recovery over Network](#), the Save Scan Information File dialog box will appear when you select a place to store scan info. You may save it to the local or remote computer.

To load scan information

- 1 Select an object in the R-Studio Drives panel
- 2 Select Open Scan Information on the Drive or shortcut menu and select the required file with the scan information

The default file extension is *.scn.

If a remote computer is connected for [Data Recovery over Network](#), the Open Scan Information File dialog box will appear when you select a place to load scan info from. You may load it from the local or remote computer.

- > The scan information will appear in the Drives panel

To remove scan information

- 1 Select an object in the R-Studio Drives panel
- 2 Select Remove Scan Information on the Drive or shortcut menu

- > The scan information will disappear from the Drives panel

NEVER TRY TO SAVE SCAN INFORMATION ON THE OBJECT BEING SCANNED!!!
Or you may obtain unpredictable results and lose all your data.

2.2.2 Fast Search for Lost Partitions

[Drive scan](#) gives very detailed and accurate results but takes long time. If you want to find only [partitions](#) previously existed on the drive you may use fast search for lost partitions which is much faster.

To perform fast search for lost partitions,

- 1 Select an object in the R-Studio's Drives panel

Fast search for lost partitions

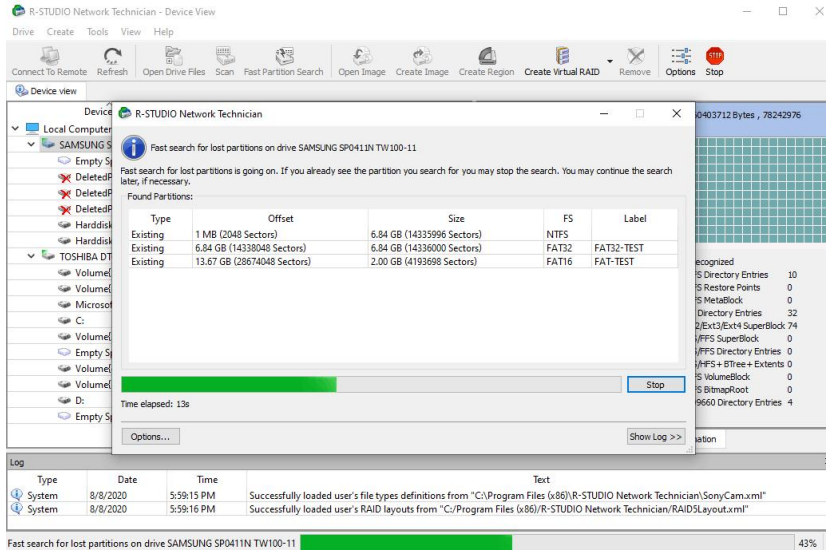

Device/Disk	Label	FS	Start	Size	Name	Value

Type	Date	Time	Text
System	8/8/2020	5:59:15 PM	Successfully loaded user's file types definitions from "C:\Program Files (x86)\R-Studio Network Technician\SonyCam.xml"
System	8/8/2020	5:59:16 PM	Successfully loaded user's RAID layouts from "C:\Program Files (x86)\R-Studio Network Technician\RAIDSLayout.xml"

2 Click the Partition Search button

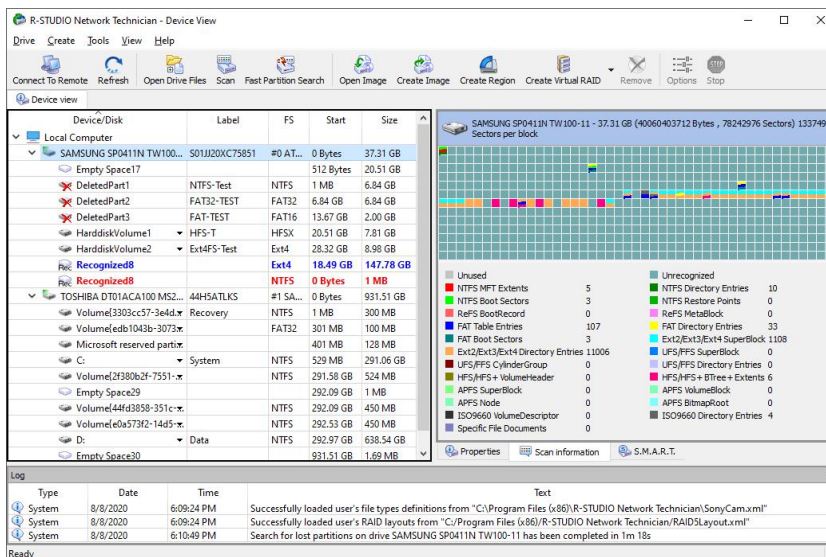

R-Studio will start searching for lost partitions showing its progress.

Fast search for lost partitions

> **R-Studio** will show fast found partitions in blue.

Fast search for lost partitions

You may right-click the partition and select Complete scan to scan the entire drive.

2.2.3 Customizing File Types

You may create your own [known file types](#) and add their file signatures for scanning in Known File Types. They will appear in their respective folders on the [File Types](#) dialog box.

You can do that either by using the **R-Studio's** graphic interface or by direct editing the known file description file specified on the **R-Studio** [Main](#) settings dialog box.

Creating a Known File Types using a Graphic User's Interface

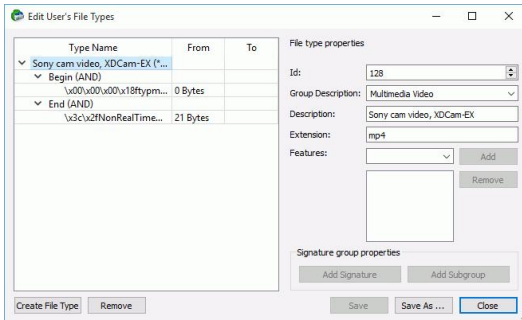

The easiest way to add your own is to use the **R-Studio's** graphic interface.

To create a Known File Type,

1 On the [Known File Types](#) settings dialog box, click the **Edit User's File Types...** button

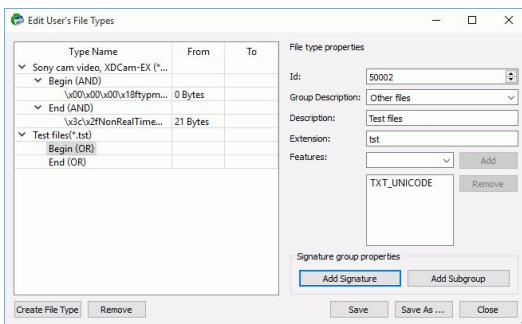

> The **Edit User's File Types dialog box** will appear

Edit User's File Types **dialog box**

2 Click the **Create File Types** button and specify **File type properties**

Edit User's File Types **dialog box**

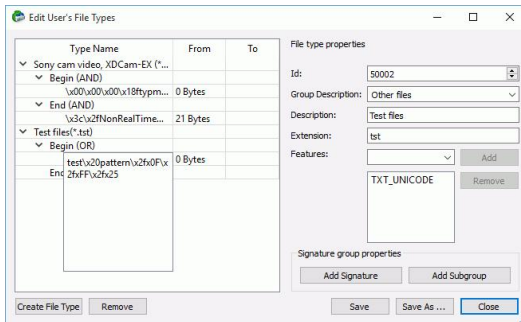

File Types properties

id	digit	Required	Digital file type identifier. Should be unique for each custom file type.
group	string	Optional	Specifies a file type group in which found files will appear. You may specify either your own groups or select those predefined on the File Types dialog box.
description	string	Optional	Brief file description
features	NO_SCAN TXT_ANSI TXT_UNICODE	Optional	<p>Additional properties of the file type. If you want to specify several properties, they should be separated by a space.</p> <p>NO_SCAN: Not to be scanned for. If this flag is used, R-Studio will not search for such file type. Such files will be shown when sorting files by their extensions.</p> <p>TXT_ANSI: The file can be viewed as ANSI text. If this flag is specified, the file can be correctly represented as an ANSI text. When previewing, this file will be immediately sent to Text? hexadecimal editor.</p> <p>TXT_UNICODE: The file can be viewed as UNICODE text. If this flag is specified, the file can be correctly represented as a UNICODE</p>

			text. When previewing, this file will be immediately sent to Text/? hexadecimal editor .
extension	<string>	Optional	File extension.

3 Click the **Add Signature** button, specify the signature parameters, and click the **Save** button

Edit User's File Types dialog box

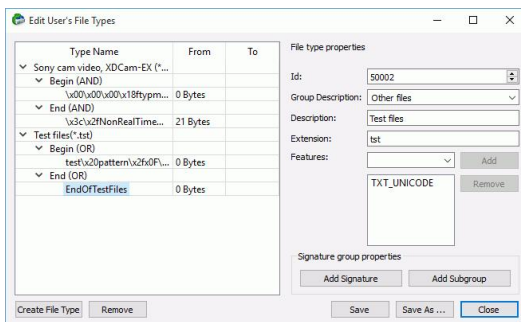

File signature properties

Begin	Specifies from where the signature begins.
End	If End , the offset is from the end of file to the first byte of the signature. That is, if the signature is two bytes long, the offset value should be 2.
AND	Shows the order of the logical operation (union or intersection)
OR	
From	A decimal number specifying the leftmost possible offset for the file signature.
To	A decimal number specifying the rightmost possible offset for the file signature.

You may specify as many signatures as you need. Moreover, you may specify subgroups within a signature using the **Add Subgroup** button. The structure of such possible subgroups is described on the [Customizing File Types-II](#) help page.

- > **The newly specified file type will appear on the** Edit User's File Types **dialog box** and the [File Types dialog box](#)

Edit User's File Types dialog box

2.2.4 Customizing File Types-I

The syntax of signature description is similar to that of the XML language. They are stored in the file specified on the **R-Studio Main** settings dialog box.

More advanced features are described in [Customizing File Types-II](#).

Signature file example

```
<?xml version="1.0" encoding="utf-8"?>
  <FileTypeList>
    <FileType id="2" group="archive" description="ARJ Archive" extension="arj">
      <Signature offset="3" count="1">Abc\x5c\x00\x04</Signature>
      <Signature offset="9" count="2">\x23\x01\xf4</Signature>
    </FileType>
  </FileTypeList>
```

File structure

File header

The file starts with a standard XML header

```
<?xml version="1.0" encoding="utf-8"?>
```

Section FileTypeList

```
<FileTypeList>
```

It requires a closing element `</FileTypeList>`.

Section FileType

This is a description of each file signature.

Attributes:

id	<u32>	Required	Digital file type identifier. Should be unique for each file type.	
group	<string>	Optional	Specifies a file type group in which found files will appear. You may specify either your own groups or those predefined on the File Types dialog box.	Default: unknown
description	<string>	Optional	Brief file description	Default: null (no description)
features	NO_SCAN TXT_ANSI TXT_UNICODE	Optional	Additional properties of the file type. If you want to specify several properties, they should be separated by a space.	Default: 0
extension	<string>	Optional	File extension.	Default: null (no extension)

File type properties flags

NO_SCAN	Not to be scanned for. If this flag is used, R-Studio will not search for such file type. Such files will be shown when sorting files by their extensions.
TXT_ANSI	The file can viewed as ANSI text. If this flag is specified, the file can be correctly represented as an ANSI text. When previewing, this file will be immediately sent to Text/?hexadecimal editor .
TXT_UNICODE	File can viewed as UNICODE text. If this flag is specified, the file can be correctly represented as a UNICODE text. When previewing, this file will be immediately sent to Text/Hexadecimal editor .

This section can contain an unlimited number of the `Signature` elements. If there are several `Signature` elements, that means that all those signatures are simultaneously present in the file. Such signatures should have different `offset` attributes and they should not overlap.

Element `Signature`

The element contains a string value of the file signature consisting of ASCII characters and hex bytes in the `\xhh` format, where `hh` is a hexadecimal byte code. If there is not a hexadecimal number after `\x`, `\x` are treated as a part of the string section of the signature

Attributes:

<code>offset</code>	<u16>	Optional	Decimal offset for the signature	Default: 0
<code>count</code>	<u16>	Optional	Decimal number specifying the number of signatures of the same length. Used when several signatures of the same length starting with the same offset can be present in a file. In this case they should be sequentially written in the element, and the <code>size</code> attribute specifies the length of signature. <code>count*size</code> should be equal to the number of bytes in the element. If only one signature can be on this offset, <code>count</code> should be equal "1", and <code>size</code> should be equal to the length (the number of bytes) of the signature.	Default: 1
<code>size</code>	<u16>	Optional	Decimal number specifying the number of bytes in the signature.	Default: the number of bytes written in the element.
<code>from</code>	<code>begin</code> <code>end</code>	Optional	Specifies from where the <code>offset</code> is calculated. If <code>end</code> , the <code>offset</code> is from the end of file to the first byte of the signature. That is, if the signature is	Default: <code>begin</code>

			two bytes long, the offset value should be 2.	
--	--	--	---	--

Comments

```
<!-- Comment string -->
```

An XML standard string for a comment.

2.2.5 Customizing File Types-II

Currently **R-Studio** supports two versions of file type descriptions. Version 2 extends legacy Version 1 by adding variable signature offsets and AND/OR combination of several signatures in one file type. The version of file type description is specified by the version attribute of the `FileTypeList` section. Version 1 is the default option.

File structure**Elements common to Versions 1 and 2 of file type description****File header**

The file starts with a standard XML header

```
<?xml version="1.0" encoding="utf-8"?>
```

Section `FileTypeList`

```
<FileTypeList>
```

Attributes:

version	1.0 2.0	Optional	Version of file type description	Default: 1.0
---------	------------	----------	----------------------------------	--------------

It requires a closing element `</FileTypeList>`.

Comments

```
<!-- Comment string -->
```

An XML-standard string for a comment.

Version 1 of file type description**Signature file example**

```
<FileTypeList>
  <FileType id="2" group="archive" description="ARJ Archive" extension="arj">
    <Signature offset="3" count="1">Abc\x5c\x00\x04</Signature>
    <Signature offset="9" count="2">\x23\x01\xF4</Signature>
  </FileType>
</FileTypeList>
```

Section `FileType`

This is a description of each file signature.

Attributes:

id	<u32>	Required	Digital file type identifier. Should be unique for each file type.	
group	<string>	Optional	Specifies a file type group in which found files will appear. You may specify	Default: unknown

			either your own groups or those predefined on the File Types dialog box. See the table below.	
description	<string>	Optional	Brief file description	Default: null (no description)
features	NO_SCAN TXT_ANSI TXT_UNICODE	Optional	Additional properties of the file type. If you want to specify several properties, they should be separated by a space.	Default: 0
extension	<string>	Optional	File extension.	Default: null (no extension)

File type properties flags

NO_SCAN	Not to be scanned for. If this flag is used, R-Studio will not search for such file type. Such files will be shown when sorting files by their extensions.
TXT_ANSI	The file can be viewed as ANSI text. If this flag is specified, the file can be correctly represented as an ANSI text. When previewing, this file will be immediately sent to Text/Hexadecimal editor .
TXT_UNICODE	The file can be viewed as UNICODE text. If this flag is specified, the file can be correctly represented as a UNICODE text. When previewing, this file will be immediately sent to Text/Hexadecimal editor .

List of predefined file type groups

Group	Name on the File Types dialog box.
archive	Archive Files
graphics	Graphics/Picture
internet	Internet-related files
multimedia	Multimedia Files
audio	Multimedia: Audio Files
video	Multimedia: Video Files
font	Font
document	Document
doc_database	Document: Database
doc_sheet	Document: Spreadsheet
exe	Executable/Library/DLL
unknown	Other file types

This section can contain an unlimited number of the `Signature` elements. If there are several `Signature` elements, that means that all those signatures are simultaneously present in the file. Such signatures should have different offset attributes and they should not overlap.

Element `Signature`

The element contains a string value of the file signature consisting of ASCII characters and hex bytes in the `\xhh` format, where `hh` is a hexadecimal byte code. If that is not a hexadecimal number after `\x`, `\x` are treated as a part of the string section of the signature

Attributes:

offset	<u16>	Optional	Decimal offset for the signature	Default: 0
count	<u16>	Optional	Decimal number specifying the number of signatures of the same length. Used when several signatures of the same length starting with the same offset can be present in a file. In this case they should be sequentially written in the element, and the <code>size</code> attribute specifies the length of signature. <code>count*size</code> should be equal to the number of bytes in the element. If only one signature can be on this offset, count should be equal to "1", and size should be equal to the length (the number of bytes) of the signature.	Default: 1
size	<u16>	Optional	Decimal number specifying the number of bytes in the signature.	Default: the number of bytes written in the element.
from	begin end	Optional	Specifies from where the offset is calculated. If end, the offset is from the end of file to the first byte of the signature. That is, if the signature is two bytes long, the offset value should be 2.	Default: begin

Version 2 of file type description**Signature file example**

```
<?xml version="1.0" encoding="utf-8"?>
<FileTypeList version="2.0">
  <FileType id="5626" group="_Test" description="Test file" extension="tst">
    <Begin combine="and">
      <Signature from="0" to="20">ABC</Signature>
      <Signature offset="1">CDEFG</Signature>
    <AND>
      <Signature offset="0">DE</Signature>
      <Signature offset="0">RTD</Signature>
    <OR>
      <Signature offset="12">CP</Signature>
      <Signature offset="16">RTD</Signature>
    </OR>
  </AND>
</Begin>
<End combine="or">
  <Signature from="3" to="20">ABC</Signature>
  <Signature offset="5">CDEFG</Signature>
<AND>
  <Signature offset="2">DE</Signature>
  <Signature offset="3">RTD</Signature>
<OR>
```

```

        <Signature offset="12">CP</Signature>
        <Signature offset="16">RTD</Signature>
    </OR>
</AND>
</End>
</FileType>
</FileTypeList>

```

Section `FileType`

This is a description of each file signature.

Attributes:

Similar to those in Version 1.

The section can contain one element `Begin` and one `End`. It should contain at least one of them.

Example

```

<FileTypeList version="2.0">
  <FileType id="2" group="archive" description="ARJ Archive" extension="arj">
    <Begin [attributes]>
      ...
    </Begin>
    <End [attributes]>
      ...
    </End>
  </FileType>
</FileTypeList>

```

Sections `Begin` and `End`

Specify the positions of file type signatures in the file.

Attributes

combine	and or	Optional	Shows the order of the logical operation (union or intersection)	Default: and
---------	-----------	----------	--	--------------

These sections can contain one of several elements `Signature`. And one or several elements `OR` or `AND`. If there are several elements inside the section they are combined according to the attribute `combine`.

Example:

```

<FileTypeList version="2.0">
  <FileType id="2" group="archive" description="ARJ Archive" extension="arj">
    <Begin combine="or">
      <Signature [attributes]> ... </Signature>
      ...
      <Signature [attributes]> ... </Signature>
    </Begin>
    <AND>
      ...
    </AND>
    <OR>
      ...
    </OR>
  </FileType>
</FileTypeList>

```

```

    <Signature [attributes]> ... </Signature>
    ...
    <Signature [attributes]> ... </Signature>
  </End>
</FileType>
</FileTypeList>

```

Sections AND and OR

These sections can contain one of several elements `Signature`. And one or several elements `OR` or `AND`. If there are several elements inside the section they are combined according to the section type (logical `AND` or `OR`).

Example:

```

<FileTypeList version="2.0">
  <FileType id="2" group="archive" description="ARJ Archive" extension="arj">
    <Begin>
      <Signature [attributes]> ... </Signature>
      ...
      <Signature [attributes]> ... </Signature>
      <AND>
        <Signature [attributes]> ... </Signature>
      <OR>
        <Signature [attributes]> ... </Signature>
      <AND>
        <Signature [attributes]> ... </Signature>
        <Signature [attributes]> ... </Signature>
      </AND>
      <OR>
        <Signature [attributes]> ... </Signature>
        <Signature [attributes]> ... </Signature>
      </OR>
    </OR>
    <Signature [attributes]> ... </Signature>
  </AND>
</Begin>
</FileType>
</FileTypeList>

```

Element `Signature`

The element contains a string value of the file signature consisting of ASCII characters and hex bytes in the `\xhh` format, where `hh` is a hexadecimal byte code. If that is not a hexadecimal number after `\x`, `\x` are treated as a part of the string section of the signature

Attributes:

Attribute	Value	Required	Description	Default
<code>offset</code>	<code><u16></code>	Optional	Decimal offset for the signature	Default: 0
<code>from</code>	<code><u16></code>	Optional	Decimal number specifying the leftmost possible offset for the file signature. Ignored if the <code>offset</code> attribute is specified.	Default: undefined
<code>to</code>	<code><u16></code>	Optional	Decimal number specifying the rightmost possible offset for the file signature.	Default: undefined

			Ignored if the <code>offset</code> attribute is specified.	
size	<u16>	Optional	Decimal number specifying the number of bytes in the signature.	Default: the number of bytes written in the element.

Example:

```
<FileTypeList version="2.0">
  <FileType id="2" group="archive" description="ARJ Archive" extension="arj">
    <Begin>
      <Signature offset="3">Abc\x5c\x00\x04</Signature>
      <Signature from="9" to="15">\x23\x01\xf4</Signature>
    </Begin>
  </FileType>
</FileTypeList>
```

2.2.6 Regions

Scanning large objects may take a long time. Sometimes, only a smaller area of a drive needs to be scanned or searched for files. Such area is called a *region*. A [region](#) can be created on any object in the **R-Studio's** Drives panel.

Created regions can be scanned, and files on them can be recovered in the same way as from drives or [logical disks](#).

Created regions can be deleted or their size can be changed.

Note: **R-Studio** does not create anything real on the drive. Regions are virtual objects that do not affect actual data on the drive.

To create a region**1 Select an object in the R-Studio's Drives panel and click the Create Region button****Other ways to create the region**

- Right-click the selected object and select **Create Region** on the shortcut menu
- or
- Select the object and select **Create Region** on the **Create** menu
- or
- Select the object and press the **F4** key on the keyboard

2 Specify required parameters on the Create region dialog box and click the Create button

Create region dialog box

**Region options**

Drive size:	Shows size of the object where the region is to be created. The region cannot be larger than this size.
Start:	Start point of the region
Size:	Size of the region. Cannot be larger than Drive size.

Numbers in these fields can be in bytes or sectors. See the [Data Formats and Multipliers](#) topic for more details on data formats.

> A Region object will appear in the Drives panel.

Device/Disk	Label	FS	Start	Size
Region 0 on SAMSU...			0 Bytes	1.50 GB
F:	NTFS-Test	NTFS	32 KB	6.76 GB

C:	System	NTFS	529 MB	292.01 GB
Volume{e0a573f2-1...		NTFS	292.53 GB	450 MB
D:	Data	NTFS	292.97 GB	638.54 GB
Empty Space32			931.51 GB	1.69 MB
Marvell 91xx Config 1.01				
PIONEER DVD-RW DVR...				

To change the size of a region

- * Right-click the Region in the R-Studio Drives panel, select **Edit** on the shortcut menu, and enter a new size on the Edit Region dialog box.

To convert a region into an exclusive one

- * Right-click the Region in the R-Studio Drives panel and select **Exclude area** on the shortcut menu

To remove a region

- * Select a Region in the R-Studio Drives panel and click the **Remove** button, or Right-click the selected region and select **Remove Region** on the shortcut menu.

2.2.7 Exclusive Regions

Exclusive regions are areas on any object visible in the **R-Studio's** Drives panel that are excluded from drive operations. **R-Studio** never tries to read/write data from/to such area. Exclusive regions are necessary when, for example, there are areas with [bad sectors](#) on a drive, and it is necessary to avoid any drive operations with such areas to not inflict further damage to such drive and to speed work with it.

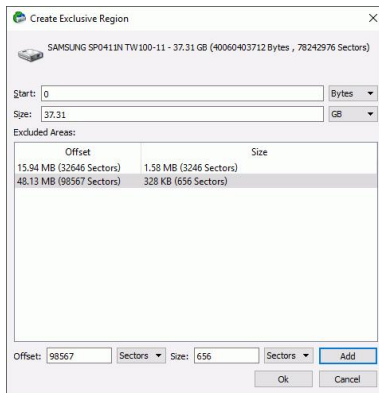

Note: **R-Studio** does not create anything real on the drive. Exclusive regions are virtual objects that do not affect actual data on the drive.

To create an exclusive region

- 1 Right-click an object in the **R-Studio's** Drives panel and select **Create Exclusive Region** on the shortcut menu, or
Select the object and select **Create Exclusive Region** on the **Create** menu

2 Specify required parameters on the Create Exclusive Region dialog box and click the Add button

Create exclusive region dialog box

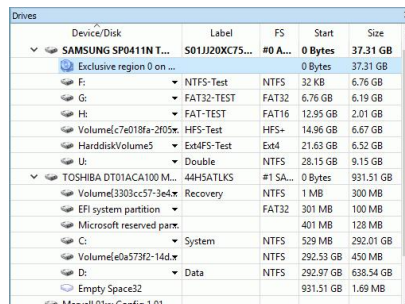

Exclusive Region options

Start:	Start point of the entire exclusive region
Size:	Size of the entire exclusive region. Cannot be larger than Drive size.
Offset:	Offset of the excluded area.
Size:	Size of the excluded area.

Numbers in these fields can be in bytes or sectors. See the [Data Formats and Multipliers](#) topic for more details on data formats.

> An Exclusive Region object will appear in the Drives panel.

Its properties can be seen on the Excluded Areas tab.

To remove an exclusive region

- * Select an Exclusive Region in the R-Studio Drives panel and click the Remove button, or Right-click the selected region and select Remove Region on the shortcut menu.

To change the size of an exclusive region

- * **Right-click an Exclusive Region in the R-Studio Drives panel, select Edit on the shortcut menu, and add/remove excluded areas on the Edit Exclusive Region dialog box.**

You may remove an excluded area by right-clicking it and selecting **Remove** on the shortcut menu.

2.2.8 Images

An *image* is an exact, byte by byte, copy of any object in the Drives panel. When created, images can be processed like their original objects.

Images are very useful if there is a risk of total data loss due to hardware malfunction. If bad blocks are constantly appearing on a drive, you must immediately create an image of this drive. All data search, scan and restoring can be done from this image.

While creating images, **R-Studio** can simultaneously perform drive scan and save scan information to lessen time necessary to process the drive.

The image can be saved on the remote computer if it is created [via network](#). **R-Studio** can also load and process images created with the **DeepSpar Disk Imager™**.

An imaging process can be stopped and then resumed later on.

R-Studio Corporate version and higher can create images directly on hard drives making in fact disk clones.

To create an image,

- 1 **Select an object in the R-Studio's Drives panel and click the Create Image button**

Other ways to create the image

- Select the object and select **Create Image** on the **Drive** menu
- or
- Right-click the selected object and select **Create Image File** on the shortcut menu

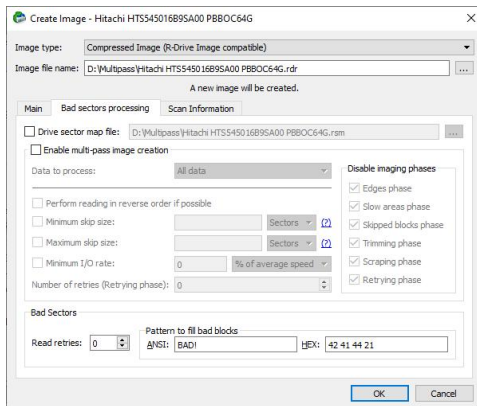

- 2 **Specify image options, a file name, and destination for the image on the Create Image dialog box**

Note: To store an image file, you need a [free space](#) equal to at least the object size.

Create Image (Main) dialog box

Create Image (Bad sector processing) dialog box

Create Image (Scan Information) dialog box

Image Options

Image filename	Specifies the name and path for the image file
Image type:	<p>Compressed image (R-Drive Image compatible): If this option is selected, R-Studio will create an image file which can be compressed, split into several parts, and password-protected. This image file is fully compatible with the images created by R-Drive Image, but incompatible with very old versions of R-Studio.</p> <p>Byte by byte image to a file: If this option is selected, R-Studio will create a simple exact copy of the object.</p> <p>Byte to byte image to a physical disk: R-Studio will create an exact copy of the disk on another hard drive. Data on the target drive will be overwritten. Available in the Corporate, Technician, and T80+ licenses.</p> <p>Some other image formats are also available in the Technician, and T80+ licenses. You may read more about these formats in the Supported Virtual Disk and Disk Image Formats page.</p>
Image compression ratio	You may compress the data in the image to save space. Active only if the Compressed image (R-Drive Image compatible) is selected.
Estimated size	Shows the estimated size of the image file. An actual image size depends on how much empty space is on the selected partition and what file types are there. Active only if the Compressed image (R-Drive Image compatible) is selected.

Image split size	You may set this option to Automatic and let Windows decide how to split the image file. This mostly depends on the file system on the destination drive. You may also either explicitly specify the split size, or choose a preset for various devices with removable storage. Select Fixed size for that. Active only if the Compressed image (R-Drive Image compatible) is selected.
Password Encrypt image	You may protect your image file with a password. Note: If you leave the Encrypt image option clear this feature will provide a relatively moderate protection against conventional unauthorized access. If this option is selected, R-Studio will encrypt the image using the AES-XTS algorithm. Note: Only files in the RDR format can be password protected and encrypted.
Create scan information file	If this option is selected, R-Studio will perform drive scan simultaneously with image creation. See the Drive Scan help page to learn scan options.
Read retries	Specifies a value for I/O Tries, or how many times R-Studio will try to read a bad sector . R-Studio treats bad sectors in the following way: It reads a certain part of drive (predefined by Windows) and <ul style="list-style-type: none"> • If Default read attempts is set to 0, the entire part with bad sectors will be filled with the specified pattern. • If Default read attempts is set to a non-zero value, R-Studio reads again that part sector by sector, repeating the attempts the specified number of times. If R-Studio still cannot read a bad sector, it fills the sectors with the specified pattern. In this case only the bad sectors will be filled with the pattern, but that extremely slows the drive read process. For example, if you set Default read retries to 1, a bad sector will be read 2 times.
Pattern to fill bad blocks	Specifies a pattern R-Studio will use to fill bad sectors in this image. You may specify the pattern either in the ANSI or Hex data format. Note: R-Studio will never ever try to write anything on the drive from which data is to recover or an image is to create. This pattern fills bad sectors only in the image.
Drive sector map file Enable multi-pass image creation	These options are available only in the Technician/T80+ versions. Read more about these options in the I/O Monitor and Sector Map files and Multi-pass imaging help page.

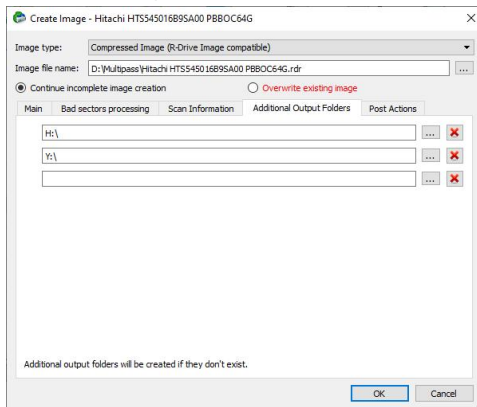

If a remote computer is connected for [Data Recovery over Network](#), the Create Image dialog box will have a different look. You may save the image to the local or remote computer.

R-Studio Technician/T80+

These options are available only in the **Technician/T80+** versions.

Create Image (Additional output folders) dialog box

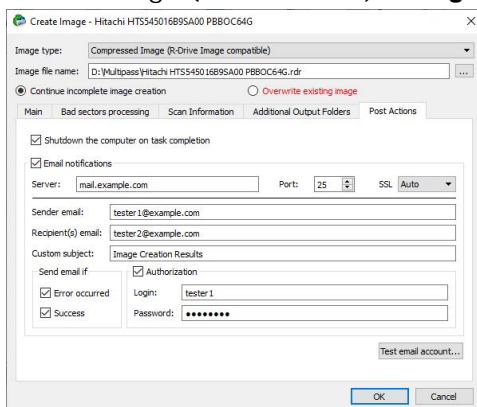

Additional output folders

Additional output folders

Additional output folders where image files will be stored when **R-Studio** runs out of space.

Create Image (Post Actions) dialog box

Post Actions Options

Shutdown the computer on task completion

If this check box is selected, **R-Studio** will shut down your computer when image creation has been completed.

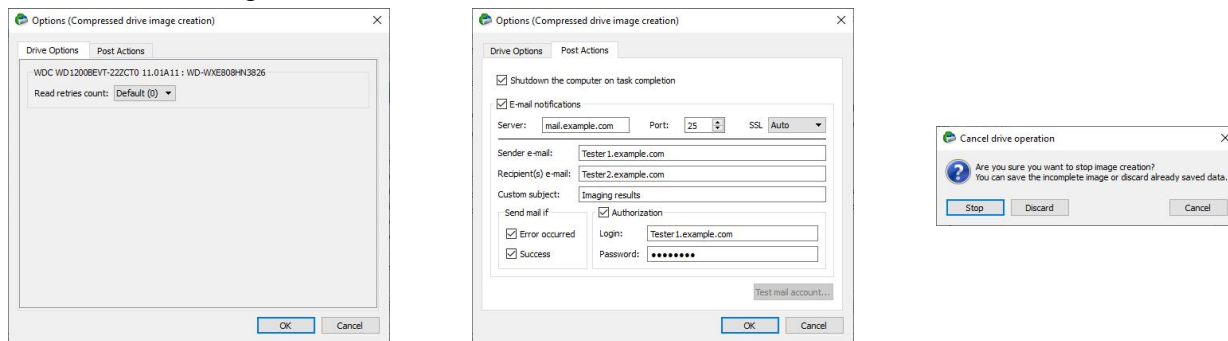

E-Mail notifications

If this check box is selected, **R-Studio** will inform you about the outcome of the operation via email.

> **R-Studio** will start creating the image, the Progress message showing the progress.

You may change some options during the imaging process. Click the **Options** button and change them as necessary/

You may stop the imaging process and then resume it later on. Click the **Stop** button and the Cancel drive operation dialog box will appear. Select **Stop** if you want to keep the partially created image or **Discard** if you don't need this image file.

To resume the creation of the image for the same object, select the same file name for the image. You'll be able to create a new image file or continue to create the image for the object.

Resuming image creation

R-Studio will create a new file for every new start of imaging for the `.rdi` and `.vmdk` file types.

To process an already created *Image*, the image file should be opened.

To open an image

1 Click the **Open Image** button, or

Select **Open Image File** on the **Drive** menu

If a remote computer is connected for [Data Recovery over Network](#), the Open Image File dialog box will appear when you select a place to load the image file from. You may load it from the local or remote computer.

2 Select the required image file

If the image is a multi-volume one, and not all parts are at the same place, the dialog box will appear

Multi-volume image dialog box

Specify paths to other image parts and click the OK button.

> An *Image* object will appear in the Drives panel

Depending whether this is a byte-by-byte, compressed (**R-Drive Image compatible**), multi-volume, or VMDK image, its appearance in the Drives panels is different.

You may perform all data search, scan, and recovery from this image as it were a regular drive/disk object.

A VMDK image

To close an image

- * **Select the image and click the Close Image button,**
 - or right-click the image and select **Close Image** on the shortcut menu
 - or select the image and press the **F8** key.

To close all image

- * **Select Close All Images on the Tools menu**

A [logical disk](#) (or disks) containing in an image can be mounted in the operating system as a device which makes its content accessible to any program including any other data recovery software.

To mount a logical disk in an image

- 1 **Right-click the logical disk in the image in the Drives panel and select Mount on the shortcut menu**

- 2 **Select a disk letter to assign to the mounted logical disk and click OK**

- > **A *Virtual disk* object will appear in the Drives panel**

and this virtual disk will be available to system in the read-only mode

To unmount a virtual disk from the system

- 1 **Right-click the virtual disk in the image in the Drives panel and select Unmount on the shortcut menu**

2.2.9 Wiping Objects

Disk objects can be [wiped](#) in order to completely destroy its data.

Supported Wipe Algorithms

File wiping is necessary only for files stored on conventional hard drives. Files stored on new [SSD storage devices](#) cannot be effectively wiped out due to the principles of operation of these devices.

Currently **R-Studio** supports 6 wiping algorithms:

Zeroes	The disk object or file is filled with zeroes through 1 pass. The fastest but the least secure algorithm. Also it does not conceal the fact that the disk or file has been wiped.
Pseudo-random numbers	The disk object or file is filled with pseudo-random numbers through 1 pass. A slower but little bit more secure algorithm than the Zeroes algorithm and it also conceals to some degree the fact that the disk or file has been wiped.
DoD 5220.22-M(3)	The disk object or file is wiped using Department of Defense standard 5220.22-M(3). Provides high-grade data wiping filling the unused space or file with a special digital pattern through 3 passes This algorithm is very secure, but slow.
DoD 5200.28-STD(7)	The disk object or file is wiped using Department of Defense standard 5200.28-STD(7). Provides high-grade data wiping filling the unused space or file with a special digital pattern through 7 passes. This algorithm is very secure, but very slow.
Bruce Schneier(7)	The disk object or file is wiped using the Bruce Schneier(7) algorithm. The first pass overwrites the drive with the bit pattern "00", the second with "11", and the next five with a randomly generated bit pattern. This algorithm is very secure, but very slow.
Peter Gutmann (35)	The disk object or file is wiped using the Peter Gutmann's algorithm. Provides high-grade data wiping filling the unused space or file with a special digital pattern through 35 passes. This algorithm is military-level secure, but horribly slow.

What algorithm is to choose, depends on your specific needs. All of these wiping algorithms make recovery of wiped data with any software-based data recover utility impossible. So if you want to protect your information from a casual snooper, you may safely choose either the **Zeroes** or **Pseudo-random numbers** algorithm. The latter also conceals the fact that you wiped the data.

If you want more security, you need to know the following:

There are some techniques for recovery of wiped data. These techniques are based on the fact that magnetic medium on the hard drive's platters "store" some information about previously written data. Such information cannot be completely removed. Wiped data may be recovered even from mechanically damaged platters. So the only safe way to completely remove data from a hard drive is to mechanically grind the magnetic medium off the drive platters or dissolve them in special chemical solvents.

But in order to recover the wiped data using one of these techniques, a hard drive must be disassembled, its platters placed in a precise magnetic field measurement system, and the results of such measurement statistically processed. All that is very expensive and requires a very qualified and experienced personnel and a specially developed equipment. Only a very advanced organization such as a law enforcement or intelligence agency of a developed nation, or a special high-tech firm can afford this. Moreover, each successive wiping pass makes such

data recovery much and much harder. So, the **DoD 5220.22-M(3)** clearing and sanitizing standard overwriting the data with a special pattern through 3 passes is a rather reliable and safe choice for this case.

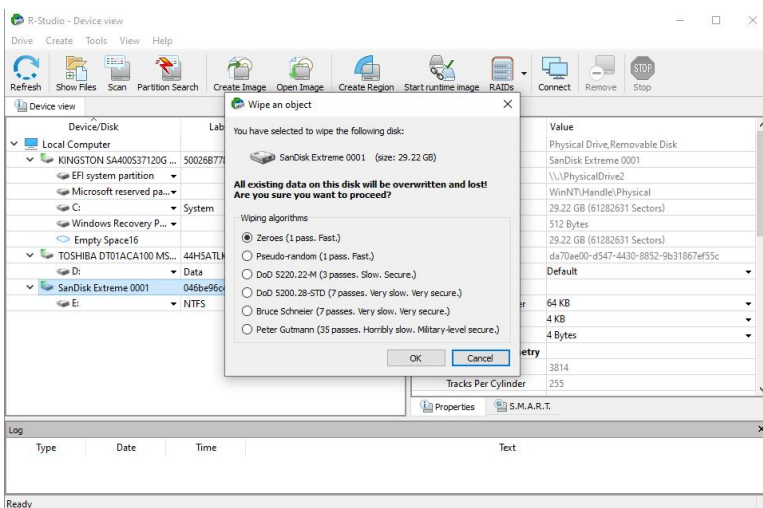

If you need the ultimate security, use the **DoD 5220.22-M(7)** clearing and sanitizing standard, the **Bruce Schneier(7)**, or even the **Peter Gutmann (35)** wiping algorithms. They render data almost unrecoverable, but they are extremely slow.

Wiping Disk Objects:

To wipe a disk object,

- 1 Right-click the disk object in the Device view pane and select Wipe...
- > The Wipe an object dialog box will appear.

Wiping Disk Objects

- 2 Select the desired wiping algorithms and click the OK button.
- > R-Studio will start wiping the object.

2.3 Mass File Recovery

Recovery of multiple files

If you need to recover multiple files you may do it through the following steps:

- 1 **Find and mark all the necessary files**
Go to the [Find and Mark Multiple Files](#) topic for more information
- 2 **Recover all marked files in a single file recovery step**
Go to the [Recover Multiple Files](#) topic for more information
- 3 **Create file recovery lists to manually edit the list of files to recovery (Technician/T80+ version)**
Go to the [File Recovery Lists](#) topic for more information

Memory considerations

R-Studio stores information about found files in computer memory. If there are too many files, **R-Studio** may run out of it. To avoid this, you have two options:

Recover all files

If you want to recover data from an entire file system object (a [logical disk](#), [partition](#), [partition image](#), etc.), you may use the **Recover All Files** command from the **Drive** or shortcut menu. Right click the object in the Drives panel to access the shortcut menu. A [Recover](#) dialog box will appear. Select required restore settings, including file mask. This command restores unlimited number of files without memory restrictions.

View file information in steps

As soon as **R-Studio** nearly runs out of memory, a Too many files... message appears. You may temporarily stop file listing and browse through found files. Then you can resume file listing. You also may skip this file section and continue file listing.

In all cases, **R-Studio** keeps information about the entire file structure.

- [Find and Mark Multiple Files](#)
- [Recover Multiple Files](#)

2.3.1 Find and Mark Multiple Files

If you need to find and mark many files at once, you may do that in the following ways:

By sorting them by their extensions or creation/Modification/Accessed time

To sort files by their extensions or creation/Modification/Accessed time,

- * In the **Folders** panel select the tab
 - Extensions** to sort the files by their extensions
 - Creation Time** to sort the files by their creation time
 - Modification Time** to sort the files by their modification time
 - Accessed Time** to sort the files by their accessed time
- ▣ ***Other ways to sort files by their extensions or creation/Modification/Accessed time***
 - Select the disk in **Drives** panel, select **Open Drive Files Sorted By** on the **Drive** menu, and select the respective option,
 - or
 - In the **Drives** panel, right-click the disk and select **Open Drive Files Sorted By** on the shortcut menu and select the respective option,
 - or
 - In the **Folders** panel, right-click the disk letter and select **Show Files Sorted By** on the shortcut menu and select the respective option,
- > **R-Studio will show the sorted files in the **Folders** and **Content** panels, showing the path to each file:**
 - Folders panel for files sorted by their extensions

Content panel with files/folders sorted by their extensions

To return to the conventional view,

- * In the Drives panel, right-click the logical disk, select **Open Drive Files Sorted By** on the shortcut menu, and select **Real File System Structure**,

or

In the Folders panel, select **Show Files Sorted By** on the **Drive** menu and select **Real File System Structure**

or

Click the **Real** tab

By finding and marking multiple files using the [Find/Mark](#) dialog box

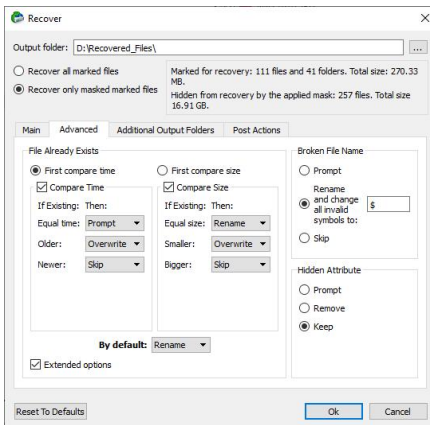

You may find and mark all the files on the entire disk by using **Mark matched files** in the **Find/Mark** mode option. You may specify all the necessary search options and mark all the found files. Please note that each find and mark/unmark operation is independent from previous ones. That is, if a file matches the search criteria, it will be marked/unmarked regardless of its previous marked/unmarked state.

For example, if you first mark all `doc` files, and then all `txt` files, all `doc` files remain marked, too. If you then decide to unmark all files smaller than 2 kB, all `doc` and `txt` files will stay marked except those that less than 2 kB.

2.3.2 Recover Multiple Files

If **R-Studio** while recovering files encounters either an already existing file or file with a broken name, normally it will stop working and ask you what to do with the file. If you recover multiple files, that may require you answer a lot of the same questions. You may use **Mass File Recovery Options** on the [Recover](#) dialog box to instruct **R-Studio** what to do in those cases for all files.

Recover (Advanced) dialog box

Advanced file recovery options

File Already Exists	These options instruct R-Studio what to do if there already exists a file with the same name.
Extended options	If this option is selected, more advanced options become accessible to process multiple duplicates of the file.
Prompt	If this option is selected, R-Studio asks the user what to do for each such file. It stops file recovery until it receives the answer.
Rename	If this option is selected, R-Studio adds a File ID to the file name. If a file already exists with the same name and that file ID, a number will be added to the file name and file ID.
Skip	If this option is selected, R-Studio skips all new files with the same name.
Overwrite	If this option is selected, R-Studio overwrites the existing file with the new one.
Overwrite Older	If this option is selected, R-Studio overwrites the existing file with the new one if the existing file is older than the new file. The time stamp used is Modified.
Overwrite Smaller	If this option is selected, R-Studio overwrites the existing file with the new one if the existing file is smaller than the new file. The time stamp used is Modified.
Overwrite Bigger	If this option is selected, R-Studio overwrites the existing file with the new one if the existing file is bigger than the new file. The time stamp used is Modified.
Broken File Name	These options instruct R-Studio what to do if a file to be recovered appears to have an invalid name.
Prompt	If this option is selected, R-Studio shows the standard Broken File Name dialog box for each file with a broken file name. It stops file recovery until it receives the answer.
Rename and change all invalid symbols to:	If this option is selected, R-Studio changes all invalid characters to the character specified.
Skip	If this option is selected, R-Studio skips all files with broken file names.
Hidden Attribute	These options instruct R-Studio what to do if a file to be recovered appears to have the Hidden attribute.
Prompt	If this option is selected, R-Studio asks the user what to do with the attribute. It stops file recovery until it receives the answer.

Remove	If this option is selected, R-Studio removes the Hidden attribute from all files.
Keep	If this option is selected, R-Studio keeps the Hidden attribute for all files.

Extended options

These options give you more flexible ways to process multiple files with the same name. You may compare files by time (Modified) and size, and decide what **R-Studio** should do with those duplicates. If any of the files has an invalid time, the comparison by time is skipped. In this case, if comparison by size is not active, **R-Studio** goes to the default action..

Extended advanced file recovery options

First compare time First compare size	These options instruct R-Studio which condition to use first, file time or size.
Compare time Compare size	These options instruct R-Studio to enable comparison by time and size..
Actions	These selectable actions instruct R-Studio what to do if the condition is met.
Empty field	If this option is selected, R-Studio skips the condition.
Prompt	If this option is selected, R-Studio asks the user what to do for each such file. It stops file recovery until it receives the answer.
Rename	If this option is selected, R-Studio adds a File ID to the file name. If a file already exists with the same name and that file ID, a number will be added to th file name and file ID.
Skip	If this option is selected, R-Studio skips all new files with the same name.
Overwrite	If this option is selected, R-Studio overwrites the existing file with the new one.
Time conditions	If the Modified time stamp is invalid, R-Studio will skip the comparison.
Equal time	Two time stamps are the same.
Older	The existing file is older than the new one.i
Newer	The existing file is newer than the new one.i
Size conditions	
Equal size	Two files have the same size.
Smaller	The existing file is smaller than the new one.i
Bigger	The existing file is bigger than the new one.i
By default	The action R-Studio takes when none of the comparison conditions have been met. That may happen when the comparison by size is not enabled.

2.3.3 Recovery Lists

You may create a file containing a list of files and folder found on a [disk/partition](#). Then such file may be manually edited to specify files to recover, and then loaded back into **R-Studio**. **R-Studio** will automatically mark the files in this list for recovery. Such lists are very useful, for example, when it is necessary to have many files approved for recovery by someone else who is far away from the computer where **R-Studio** is running.

You may create recovery lists for the entire disk or for specific folders. Moreover, you may create a recovery list for all files within the disk/folder, or for marked files/folders only.

All versions of **R-Studio** can create recovery lists in the plain text format with basic functionality. **R-Studio Technician/T80+** can create [custom recovery lists](#) in other formats with more advanced options

Creating a simple recovery list

To create a recovery list

- 1 For an entire disk, select **Export Recovery List** on the **File** menu, or

Right-click the uppermost folder (higher than **Root**, usually the letter or the name of the disk) and select **Export Recovery List** on the shortcut menu.

For a specific folder, right-click the folder and select **Export Recovery List** on the shortcut menu.

- 2 Specify the place to save the recovery list and other necessary options on the **Export Recovery List dialog box**

Export Recovery List dialog box

Options dialog box

Export Recovery List options

Export the entire folder/file tree Export marked file/folder names Export file/folder names	Specifies which file and folder names will be exported.
File format:	A file format for the recovery list. Only text format is available for the standalone and corporate versions. R-Studio Technician/T80+ can create custom recovery lists in other formats with more advanced options The following formats are available for R-Studio Technician/T80+ version: Plain Text HTML XML JSON CSV
File name:	Specifies a file name of the recovery list.

Editing the file recovery list

All files without any marks in the recovery list will be marked when the list is loaded into **R-Studio**. So, if you have some files in the recovery list that don't need to be recovered, just delete them from the list. In addition, you may use the following marks to specify some options

- : + Mark the file, or the folder, all its files, and subfolders within the folder.

- :* Mark the file, or the folder and its files, don't mark subfolders in the folder.
- :- Unmark the file, or the folder, its files, and subfolders in the folder.
- = Unmark the file or the folder and its files, don't unmark subfolders in the folder.
- !: Provide the information on the file. (**R-Studio Technician/T80+** only)

R-Studio processes records in the list consequently. That is, if there are the following lines in the file,

```
:+Files_to_Recover\  
:-Files_to_Delete\File_2.jpg
```

the file `File_2.jpg` won't be marked for recovery, while for the lines

```
:-Files_to_Recover\File_2.jpg  
:+Files_to_Recover\  
file File_2.jpg will be.
```

Loading the edited recovery list

To load a recovery list into R-Studio,

- * Select **Import Recovery List** from the **File** menu and select the file, or

Right-click the uppermost folder (higher than **Root**, usually the letter or the name of the disk) and select **Import Recovery List** on the shortcut menu.

- > **R-Studio** will load the file and mark the files accordingly.

An example of a simple recovery list

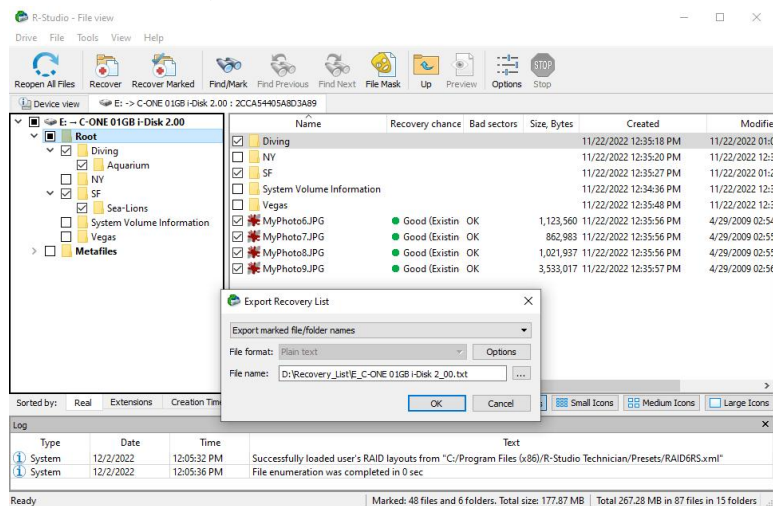

As an example, we'll create a simple recovery list, edit it to mark only those files that are to be recovered, and load it back to mark those files.

To create such recovery list

- * Mark the necessary folders, right-click the **Root** folder, and select **Export Recovery List** on the shortcut menu.

Right-click the uppermost folder (higher than **Root**, usually the letter or the name of the disk) and select **Export Recovery List** on the shortcut menu.

Export Recovery List

Specify the necessary options and click the **OK** button.

> **R-Studio will save the file.**

Structure of a simple recovery list file created by R-Studio

```
:# Version = 1
:# Sort = by real
:# PathDelim = /

SF/IMG_3535.JPG
SF/IMG_3542.JPG
SF/IMG_3579.JPG
SF/IMG_3580.JPG
SF/IMG_3581.JPG
SF/IMG_3589.JPG
SF/IMG_3590.JPG
SF/IMG_3591.JPG
SF/IMG_3592.JPG
```

```
SF/IMG_3593.JPG
SF/IMG_3594.JPG
SF/IMG_3595.JPG
SF/IMG_3596.JPG
SF/IMG_3608.JPG
SF/IMG_3627.JPG
MyPhoto6.JPG
MyPhoto7.JPG
MyPhoto8.JPG
MyPhoto9.JPG
```

If such recovery list is created from an entire logical disk/partition, it will contain several virtual folders. For example, they'll have the following structure for an NTFS partition.

```
///m/$Extend/
///m/$Extend/$Deleted/
///m/$Extend/$RmMetadata/
///m/$Extend/$RmMetadata/$Txf/
///m/$Extend/$RmMetadata/$TxfLog/
///m/$Extend/$RmMetadata/$TxfLog/$Tops
///m/$Extend/$RmMetadata/$TxfLog/$TxfLog.blf
///m/$Extend/$RmMetadata/$TxfLog/$TxfLogContainer00000000000000000001
///m/$Extend/$RmMetadata/$TxfLog/$TxfLogContainer00000000000000000002
///m/$Extend/$RmMetadata/$Repair
///m/$Extend/$ObjId
///m/$Extend/$Quota
///m/$Extend/$Reparse
///m/$AttrDef
///m/$BadClus
///m/$Bitmap
///m/$Boot
///m/$LogFile
///m/$MFT
///m/$MFTMirr
///m/$Secure
///m/$UpCase
///m/$Volume
```

Now we need to edit this file to mark for recovery the following folders/files:

1. All files in the root folder;
2. Two files `MyPhoto1.jpg` and `MyPhoto3.jpg` in the `Diving` subfolder;
3. All files in the `Diving/Aquarium/` folder;
4. All files in the `SF/` folder except the `SF/Sea-Lions/` subfolder.

The edited simple recovery list

The final simple recovery list will be the following:

```
:# Version = 1
:# Sort = by real
:# PathDelim = /
:# CaseSensitive
```

```

:# Drive = type:"Volume"; size:"1048576000"; mountpoint:"e:\"; label:"ntfs test";
fs:"NTFS";
:# Parent = type:"Drive"; size:"1048576000"; serial:"2cca54405a8d3a89";
firmware:"2.00"; product:"0lgb i-disk"; vendor:"c-one";
:= Diving/
:+ Diving/Aquarium/
:+ Diving/MyPhoto1.jpg
:+ Diving/MyPhoto3.jpg
:+ SF/

2.4 Volume Sets and RAIDs

R-Studio detects and processes valid hardware volume sets and RAIDs like regular drives/volumes.

R-Studio can analyze and recover data from software volume sets and RAIDs. If a software volume set or RAID is present in your system, **R-Studio** detects it, and a *Volume sets and RAIDs* object appears in the Drives panel. This object can be searched for files, scanned, and files found on it can be recovered the same way as from normal drives/volumes.

If, due to hardware failure, a hardware volume set or RAID cannot be accessed, or due to data loss your system does not recognize a software volume set or RAID, and you know what drives were in it, you may create a

Virtual volume set or *RAID* and process it like a real software volume set or RAID or hardware volume set or RAID.

You may find more information on RAID types in our article [What is Hardware RAID](#).

You may turn [numerical indexes](#) for objects to distinguish them better while creating virtual RAIDs.

- [Volume Sets, Stripe Sets, and Mirrors](#)
- [Basic RAID 4 and RAID 5 Operations](#)
- [Working with RAID 6 Presets](#)
- [Working with RAID6 \(Double Xor\)](#)
- [Working with RAIDs with Parity Delays](#)
- [Working with Advanced RAID Layouts](#)
- [Nested and Non-Standard RAID Levels](#)
- [Finding RAID Parameters](#)
- [Checking RAID Consistency](#)
- [Syntax of a Description File for RAID Configurations](#)
- [Description Files for RAID Configurations](#)
- [Reverse RAIDs](#)
- [Various Disk and Volume Managers](#)
- [Mounting Virtual Objects in the System](#)

Managing your own RAID layouts

To save your own RAID layout in the presets

- 1 Click the **More...** button on **Parents** tab and select **Save** on the shortcut menu.
- 2 Specify the name for the configuration on the **Preset name** dialog box.

Preset name dialog box

- > The new RAID configuration will be saved in the presets

The configurations are stored in the [user's RAID layout file](#). The path and name for this file is specified on the [R-Studio Settings](#) dialog box. If no file is specified, **R-Studio** will ask you to enter the name.

Loading your RAID configuration

If there're objects in the **Parents** tab, the preset will be applied to them. If the **Parents** tab is empty, **R-Studio** will search the drives listed in the **Drives** tab for the parents in the [user's RAID layout file](#). If the search fails, **R-Studio** will show the **Reference Parents not found** message.

To load your RAID configuration

- 1 Click the **More...** button on **Parents** tab and select the preset you want to load
- > The new RAID configuration will be loaded

To edit your own RAID configuration

- 1 Click the **More...** button on **Parents** tab and select **Edit...** on the shortcut menu

- 2 Select the required configuration on the Edit Block RAID Layout Presets dialog box.

Edit Block RAID Layout Presets dialog box

- 3 Edit the parameters of the configuration and save it
 - > The new configuration parameters will be saved.

Turning Drives On-Line and Off-Line on-the-fly

You may turn the objects in the virtual RAID or volume set on-line and off-line by selecting/clearing the checkbox on the Parents tab. It may be useful, for example, if you need to see which drive is non-actual in a RAID 5.

Actually, when you turn an object off-line, **R-Studio** substitutes it with a *Missing Drive* or *Empty Space* object.

Missing Drives and Empty Space

If one [partition](#) from a hardware volume set or RAID or software volume set or RAID is absent, due to hardware failure, for example, you need to add a virtual missing drive or empty space in order to correctly reconstruct the hardware volume set or RAID or software volume set or RAID structure. The missing drive/empty space should be placed in the same place as the missing partition.

Note: **R-Studio** does not write anything real on the drive. Missing drives/empty space are virtual objects that do not affect actual data on the drive.

To add a Missing drive/Empty space object

- 1 Select a *Volume sets and RAID*s object in the R-Studio's Drives panel
- 2 Right-click in the Parents tab in the right pane and select Add Missing Drive or Add Empty Space on the shortcut menu or select Add Missing Drive or Add Empty Space on the Create menu. Which object type is necessary, **R-Studio** decides automatically.

For the **Empty space** object, Specify its size on the Add Empty Space dialog box.

Add Empty Space dialog box

- > A *Missing Drive* or *Empty Space* object will appear in the Parents tab

2.4.1 Volume Sets, Stripe Sets, and Mirrors

To create a Volume set object

- 1 Click the Create Virtual RAID button and select Create Virtual Volume set or select the Create Virtual Volume set on the Create menu

> A Virtual Volume set object will appear in the Drives panel

Device/Disk	Label	FS	Start	Size

Virtual Volume sets and RAIDs				
Virtual volume set 1		NTFS	0 Bytes	1.75 GB
Direct Volume		NTFS	0 Bytes	1.75 GB

To create a Stripe set object (RAID 0)

- 1 Click the **Create Virtual RAID** button and select **Create Virtual Block RAID & Autodetect** or select the **Create Virtual Block RAID & Autodetect** on the **Create** menu

> **A Virtual Block RAID object will appear in the Drives panel**

2 Select RAID 0 (Stripe set) on the RAID type

3 Drag the required partitions from the Drives panel to the Parents tab

Other ways to add objects

- Right-click the Parents tab and select the required partition from the shortcut menu, or
- Right-click the partition in the Drives panel, select **Add to RAID** on the shortcut menu, and select the RAID object you want to add the partition to.

You may either make **R-Studio** to process your changes immediately or wait until you finish editing the RAID layout. Select or clear the Apply changes immediately checkbox on the Parents tab. Click the **Apply** button to apply the changes when are you through.

Note: Objects should be placed in the same order as they were in the original volume set. If this order is incorrect, you must change it by dragging the parents to place them in the correct order.

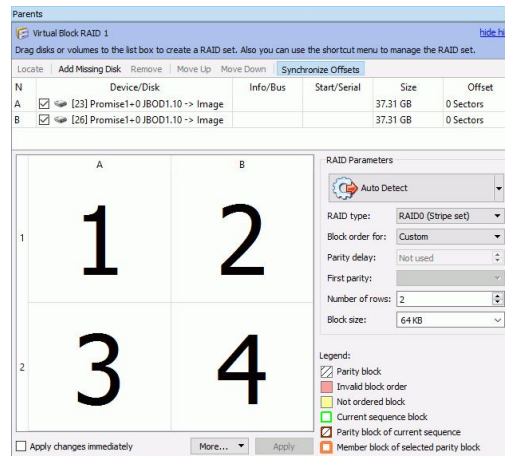

Object control buttons

Locate	Click this button to locate the selected object in the Drives panel.
Add Empty Space/Add Missing Drive	Click this button to add an empty space or missing drive object to the RAID
Remove	Click this button to remove the selected object from the RAID
Move Up	Click this button to move up the selected object in the RAID
Move Down	Click this button to move down the selected object in the RAID
Synchronize Offsets	Click this button to make the offsets the same for all objects in the RAID
Reset changes	Click this button to return the configuration to the initial state (after clicking the Apply button or immediately after loading)

The Block size and Offset (in sectors) parameters must be set the same as for the original volume set.

You also need to specify Block order. You may select it on the Blocks order drop-down or shortcut menu.

If the those parameters are not correct, data on the parents will not be damaged, but they cannot be recovered.

> **The Virtual Block RAID object can now be processed like regular drives/volumes**

If **R-Studio** detects a valid file system on the newly created RAID object, a partition object will appear in the Drives panel.

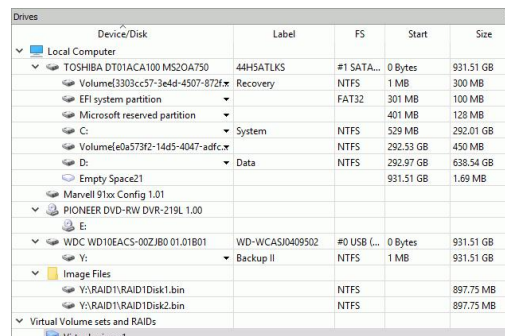

The [Description Files for RAID Configurations](#) topic shows the RAID description file for this RAID configuration.

You also may check the RAID consistency, if necessary. See the [Checking RAID Consistency](#) help page for details.

To create a Mirror set object (RAID 1)

- 1 Click the **Create Virtual RAID** button and select **Create Virtual Mirror** or select the **Create Virtual Mirror** on the **Create** menu
- > **A Virtual Mirror object will appear in the Drives panel**

2 Drag the required partitions from the Drives panel to the Parents tab

Other ways to add objects

- Right-click the Parents tab and select the required partition from the shortcut menu,
- OR
- Right-click the partition in the Drives panel, select **Add to RAID** on the shortcut menu, and select the RAID object you want to add the partition to.

Locate	Device/Disk	Info/Bus	Start/Serial	Size	Offset
<input checked="" type="checkbox"/>	Y:\RAID1\RAID1Disk1.bin	NTFS		897.75 MB	0 Sectors
<input checked="" type="checkbox"/>	Y:\RAID1\RAID1Disk2.bin	NTFS		897.75 MB	0 Sectors

> The Virtual Mirror object can now be processed like regular drives/volumes

If **R-Studio** detects a valid file system on the newly created RAID object, a partition object will appear in the Drives panel.

Device/Disk	Label	FS	Start	Size

2.4.2 Basic RAID 4 and RAID 5 Operations

RAID 4 and RAID 5 are much similar. You may create and edit a RAID 4 object the same way as a RAID 5 one.

To create a RAID 5 object

- 1 Click the **Create Virtual RAID** button and select **Create Virtual Block RAID & Autodetect** or select the **Create Virtual Block RAID & Autodetect** on the **Create** menu
- > A **Virtual Block RAID** object will appear in the **Drives panel**

Device/Disk	Label	FS	Start	Size

Virtual Volume sets and RAIDs				
Virtual Block RAID 1				

2 Select RAID 5 on the RAID type

3 Drag the required partitions from the Drives panel to the Parents tab

▣ Other ways to add objects

- Right-click the Parents tab and select the required partition from the shortcut menu, or
- Right-click the partition in the Drives panel, select **Add to RAID** on the shortcut menu, and select the RAID object you want to add the partition to.

You may either make **R-Studio** to process your changes immediately or wait until you finish editing the RAID layout. Select or clear the Apply changes immediately checkbox on the Parents tab. Click the **Apply** button to apply the changes when are you through.

Note: Objects should be placed in the same order as they were in the original RAID 5. If this order is incorrect, you must change it by dragging the parents to place them in the correct order.

▣ Object control buttons

Locate	Click this button to locate the selected object in the Drives panel.
Add Empty Space/Add Missing Drive	Click this button to add an empty space or missing drive object to the RAID
Remove	Click this button to remove the selected object from the RAID
Move Up	Click this button to move up the selected object in the RAID
Move Down	Click this button to move down the selected object in the RAID
Synchronize Offsets	Click this button to make the offsets the same for all objects in the RAID
Reset changes	Click this button to return the configuration to the initial state (after clicking the Apply button or immediately after loading)

The RAID block size and Offset (in sectors) parameters must be set the same as for the original RAID 5.

You also need to specify Block order for virtual RAID 5. You may select it on the Block order drop-down or shortcut menu.

If the those parameters are not correct, data on the parents will not be damaged, but files from the RAID 5 cannot be recovered.

Note: You may check how correctly you have reconstructed the original RAID 5. Find a file and preview it. If the file appears correct, you have created a correct RAID 5 layout.

If your RAID 5 has an unusual configuration, you may create them manually. See [Working with Advanced RAID Layouts](#) for details.

- Parity block of current sequence
- Member block of selected parity block

> The RAID 5 object can now be processed like regular drives/volumes

If **R-Studio** detects a valid file system on the newly created RAID object, a [partition](#) object will appear in the Drives panel.

The [Description Files for RAID Configurations](#) topic shows the RAID description file for this RAID configuration.

You also may check the RAID consistency, if necessary. See the [Checking RAID Consistency](#) help page for details.

Creating and saving your own RAID 5 configuration

You may create and save your own RAID configurations for non-standard RAID5s. You may specify Offset, Block order/size and Row count. See [Working with Advanced RAID 5 Layouts](#) for details.

2.4.3 Working with RAID6 (Double Xor) Presets

R-Studio allows you to create and process RAID 6 Double Xor layouts with the following presets:

EVENODD

RAID DP

X-Code(2)

Adaptec 3805

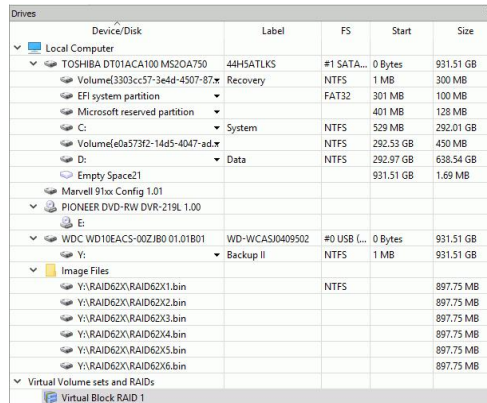

In addition you may create your own RAID 6 configurations.

Creating a RAID 6 (Double Xor) object from a preset:

We will use the EVENODD preset as an example.

To create a RAID 6 (Double Xor) object

- 1 Click the **Create Virtual RAID** button and select **Create Virtual Block RAID & Autodetect** or select the **Create Virtual Block RAID & Autodetect** on the **Create** menu
- > A Virtual Block RAID object will appear in the **Drives** panel

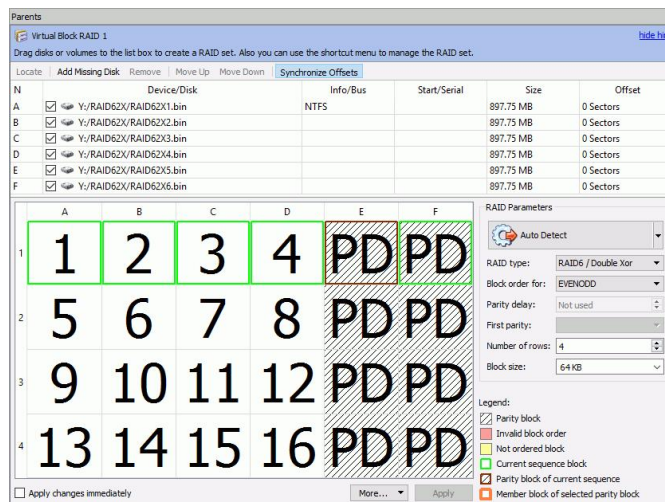

- 2 Select **RAID 6/Double Xor** on the **RAID type**
- 3 Drag the required partitions from the **Drives** panel to the **Parents** tab

Other ways to add objects

- Right-click the **Parents** tab and select the required partition from the shortcut menu, or
- Right-click the partition in the **Drives** panel, select **Add to RAID** on the shortcut menu, and select the RAID object you want to add the partition to.

You may either make **R-Studio** to process your changes immediately or wait until you finish editing the RAID layout. Select or clear the **Apply changes immediately** checkbox on the **Parents** tab. Click the **Apply** button to apply the changes when are you through.

Parents tab

Note: Objects should be placed in the same order as they were in the original volume set. If this order is incorrect, you must change it by dragging the parents to place them in the correct order.

Object control buttons

Locate	Click this button to locate the selected object in the Drives panel.
Add Empty Space/Add Missing Drive	Click this button to add an empty space or missing drive object to the RAID
Remove	Click this button to remove the selected object from the RAID
Move Up	Click this button to move up the selected object in the RAID
Move Down	Click this button to move down the selected object in the RAID
Synchronize Offsets	Click this button to make the offsets the same for all objects in the RAID
Reset changes	Click this button to return the configuration to the initial state (after clicking the Apply button or immediately after loading)

The RAID block size and Offset (in sectors) parameters must be set the same as for the original volume set.

You also need to specify Blocks order (EVENODD for our case) for virtual RAID 6 (Double Xor). You may select it on the Blocks order drop-down or shortcut menu.

If the those parameters are not correct, data on the parents will not be damaged, but they cannot be recovered.

Note: You may check how correctly you have reconstructed the original volume set or RAID. Find a file and preview it. If the file appears correct, you have created a correct RAID layout.

> The Virtual Block RAID object can now be processed like regular drives/volumes

If **R-Studio** detects a valid file system on the newly created RAID object, a [partition](#) object will appear in the Drives panel. The [Description Files for RAID Configurations](#) topic shows the RAID description file for this RAID configuration.

You also may check the RAID consistency, if necessary. See the [Checking RAID Consistency](#) help page for details.

2.4.4 Working with RAID 6 Presets

R-Studio allows you to create and process RAID 6 layouts. You may use either presets for several RAID 6 layouts, or use your own custom ones.

R-Studio provides presets for the following RAID 6 layouts:

Reed-Solomon

Left Synchronous (standard), Left Asynchronous (continuous), Right Synchronous Right Asynchronous

Creating a RAID 6 object from a preset:

We will use the Reed-Solomon (Left Synchronous (standard)) preset as an example.

To create a RAID 6 object

- 1 Click the **Create Virtual RAID** button and select **Create Virtual Block RAID & Autodetect** or select the **Create Virtual Block RAID & Autodetect** on the **Create** menu
- > A **Virtual Block RAID** object will appear in the **Drives** panel

Device/Disk	Label	FS	Start	Size
Local Computer				
TOSHIBA DT01ACA100 MS20A750	44H5ATLKS	#1 SAT...	0 Bytes	931.51 GB
Volume{3303cc57-3e4d-4507-...}	Recovery	NTFS	1 MB	300 MB
EFI system partition		FAT32	301 MB	100 MB
Microsoft reserved partition			401 MB	128 MB
C:	System	NTFS	529 MB	292.01 GB
Volume{e0a573f2-14d5-4047-...}		NTFS	292.53 GB	450 MB
D:	Data	NTFS	292.97 GB	638.54 GB
Empty Space21			931.51 GB	1.69 MB
Marvell 91xx Config 1.01				
PIONEER DVD-RW DVR-219L 1.00				
E:				
WDC WD10EACS-00ZJB0 01.01B01	WD-WCAS0409502	#0 USB ...	0 Bytes	931.51 GB
Y:	Backup II	NTFS	1 MB	931.51 GB
Image Files				
Y:\RAID6RS\img1.bin				897.75 MB
Y:\RAID6RS\img2.bin		NTFS		897.75 MB
Y:\RAID6RS\img3.bin				897.75 MB
Y:\RAID6RS\img4.bin				897.75 MB
Y:\RAID6RS\img5.bin				897.75 MB
Virtual Volume sets and RAID:				
Virtual Block RAID 1				

- 2 Select **RAID 6/Reed-Solomon** on the **RAID** type
- 3 Drag the required partitions from the **Drives** panel to the **Parents** tab

Other ways to add objects

- Right-click the **Parents** tab and select the required partition from the shortcut menu, or
- Right-click the partition in the **Drives** panel, select **Add to RAID** on the shortcut menu, and select the RAID object you want to add the partition to.

You may either make **R-Studio** to process your changes immediately or wait until you finish editing the RAID layout. Select or clear the **Apply changes immediately** checkbox on the **Parents** tab. Click the **Apply** button to apply the changes when are you through.

Parents tab

Note: Objects should be placed in the same order as they were in the original volume set. If this order is incorrect, you must change it by dragging the parents to place them in the correct order.

Object control buttons

Locate	Click this button to locate the selected object in the Drives panel.
Add Empty Space/Add Missing Drive	Click this button to add an empty space or missing drive object to the RAID
Remove	Click this button to remove the selected object from the RAID
Move Up	Click this button to move up the selected object in the RAID
Move Down	Click this button to move down the selected object in the RAID
Synchronize Offsets	Click this button to make the offsets the same for all objects in the RAID
Reset changes	Click this button to return the configuration to the initial state (after clicking the Apply button or immediately after loading)

The RAID block size and Offset (in sectors) parameters must be set the same as for the original volume set.

You also need to specify Blocks order (Left Synchronous (standard) for our case) for virtual RAID 6. You may select it on the Blocks order drop-down or shortcut menu.

If the those parameters are not correct, data on the parents will not be damaged, but they cannot be recovered.

Note: You may check how correctly you have reconstructed the original volume set or RAID. Find a file and preview it. If the file appears correct, you have created a correct RAID layout.

> The Virtual Block RAID object can now be processed like regular drives/volumes

If **R-Studio** detects a valid file system on the newly created RAID object, a [partition](#) object will appear in the Drives panel. The [Description Files for RAID Configurations](#) topic shows the RAID description file for this RAID configuration.

Device/Disk	Label	FS	Start	Size
Local Computer

Virtual Volume sets and RAIDs				
Virtual Block RAID 1		NTFS	0 Bytes	2.63 GB
Direct Volume		NTFS	0 Bytes	2.63 GB

You also may check the RAID consistency, if necessary. See the [Checking RAID Consistency](#) help page for details.

2.4.5 Working with RAID5 with Parity Delays

R-Studio allows you to create RAID5 with parity delays (any level that allows that). For example, let us create a RAID 5 with the parity delays with the following layout:

- Three drives,
- Delay=16
- Block size: 16 KB
- Offset: 1088 sectors (544 KB)
- Block order: Left Asynchronous (Continuous)

Block order table:

	A	B	C	
1	1	2	PD	Delay=16
2	3	4	PD	
3	5	6	PD	
4	7	8	PD	
5	9	10	PD	
6	11	12	PD	
7	13	14	PD	
8	15	16	PD	
9	17	18	PD	
10	19	20	PD	
11	21	22	PD	
12	23	24	PD	
13	25	26	PD	
14	27	28	PD	
15	29	30	PD	
16	31	32	PD	
17	33	PD	34	Delay=16
18	35	PD	36	

19	37	PD	38		
20	39	PD	40		
21	41	PD	42		
22	43	PD	44		
23	45	PD	46		
24	47	PD	48		
25	49	PD	50		
26	51	PD	52		
27	53	PD	54		
28	55	PD	56		
29	57	PD	58		
30	59	PD	60		
31	61	PD	62		
32	63	PD	64		
33	PD	65	66		Delay=16
34	PD	67	68		
35	PD	69	70		
36	PD	71	72		
37	PD	73	74		
38	PD	75	76		
39	PD	77	78		
40	PD	79	80		
41	PD	81	82		
42	PD	83	84		
43	PD	85	86		
44	PD	87	88		
45	PD	89	90		
46	PD	91	92		
47	PD	93	94		
48	PD	95	96		

To create such RAID 5,

- 1 Click the **Create virtual volume sets or RAID's** button and select **Create Virtual Block RAID & Autodetect** or select **Create Virtual Block RAID & Autodetect** on the **Create** menu
Check that the **Apply changes immediately** check box is clear on the **Parents** tab. This will prevent **R-Studio** from trying to start processing the RAID configuration until you specify it completely.
- 2 **Drag the required objects from the Drives pane to the Parents tab and select RAID 5 on the RAID type**
 - ▣ **Other ways to add objects**
 - Right-click the **Parents** tab and select the required partition from the shortcut menu,

or

- Right-click the partition in the Drives panel, select **Add to RAID** on the shortcut menu, and select the RAID object you want to add the partition to.

These objects may be drives, logical drives, or images. Check that the objects are correctly placed.

Note: Objects should be placed in the same order as they were in the original RAID 5. If this order is incorrect, you must change it by dragging the parents to place them in the correct order.

Object control buttons

Locate	Click this button to locate the selected object in the Drives panel.
Add Empty Space/Add Missing Drive	Click this button to add an empty space or missing drive object to the RAID
Remove	Click this button to remove the selected object from the RAID
Move Up	Click this button to move up the selected object in the RAID
Move Down	Click this button to move down the selected object in the RAID
Synchronize Offsets	Click this button to make the offsets the same for all objects in the RAID
Reset changes	Click this button to return the configuration to the initial state (after clicking the Apply button or immediately after loading)

Device/Disk	Label	FS	Start	Size
Local Computer				
TOSHIBA DT01ACA100 MS20A750	4H45ATLKS	#1 SAT...	0 Bytes	931.51 GB
Volume{3303cc57-3e4d-4507-...	Recovery	NTFS	1 MB	300 MB
EFI system partition		FAT32	301 MB	100 MB
Microsoft reserved partition			401 MB	128 MB
C:	System	NTFS	529 MB	292.01 GB
Volume{e0e573f2-14d5-4047-...		NTFS	292.93 GB	450 MB
D:	Data	NTFS	292.97 GB	638.54 GB

Virtual Volume sets and RAID5				
Virtual Block RAID 1				

3 Specify the Block size and Offset parameters on the Parents tab

Disregard the Block order field.

4 Specify the parity delay number in the Parity delay control on the Parents tab.

The number of rows will change to 48.

- ▣ If necessary, adjust the First parity parameter

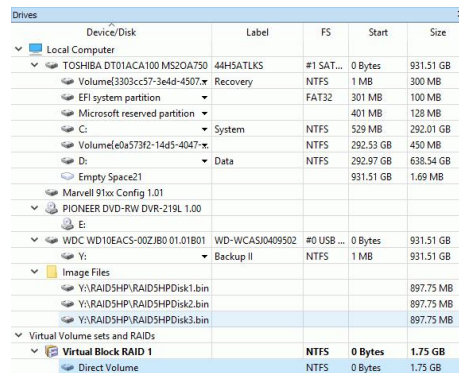

By default, this parameter is set equal to Parity delay. By changing it, you may "shift" the block order table. For example, when the First parity parameter is set as 1 for the RAID 5 of 3 drives with Parity delay of 3., the block order table will be the following:

	1 (Y:\RAID5HP\RAID5HPDisk1.bin)	2 (Y:\RAID5HP\RAID5HPDisk2.bin)	3 (Y:\RAID5HP\RAID5HPDisk3.bin)
1	1	2	PD
2	3	PD	4
3	5	PD	6
4	7	PD	8
5	PD	9	10
6	PD	11	12
7	PD	13	14
8	15	16	PD
9	17	18	PD

5 Select Left Asynchronous (Continuous) on the Block Order Field and click the Apply button on the Parents tab

- > The created Virtual Block RAID 1 object can now be processed like regular drives/volumes. If R-Studio detects a valid file system on this RAID object, a [partition](#) object will appear in the Drives panel.

The [Description Files for RAID Configurations](#) topic shows the RAID description file for this RAID configuration.

You also may check the RAID consistency, if necessary. See the [Checking RAID Consistency](#) help page for details.

2.4.6 Working with Advanced RAID Layouts

R-Studio allows you to create and process very complex custom RAID layouts.

Advanced RAID 5

For example, let us create a RAID 5 with the following layout:

- Three drives,
- Block size: 4 KB
- Offset: 32768 sectors (64 KB)
- Block order:

	A	B	C
1	PD	1	2
2	PD	3	4

3	PD	5	6
4	7	PD	8
5	9	PD	10
6	11	PD	12
7	13	14	PD
8	15	16	PD
9	17	18	PD

To create such RAID 5,

- 1 Click the **Create virtual volume sets or RAIDs** button and select **Create Virtual Block RAID & Autodetect** or select **Create Virtual Block RAID & Autodetect** on the **Create** menu

Check that the **Apply changes immediately check box** is clear on the **Parents** tab. This will prevent **R-Studio** from trying to start processing the RAID configuration until you specify it completely.

- 2 **Drag the required objects from the Drives pane to the Parents tab and select Custom on the RAID type**

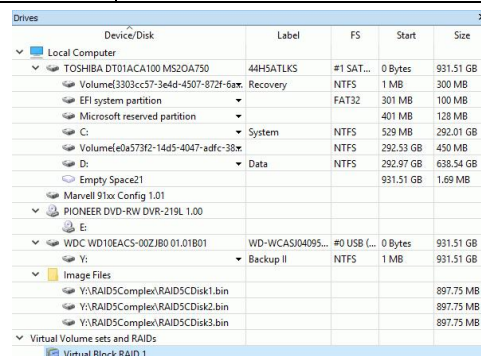

▣ Other ways to add objects

- Right-click the **Parents** tab and select the required partition from the shortcut menu, or
- Right-click the partition in the **Drives** panel, select **Add to RAID** on the shortcut menu, and select the RAID object you want to add the partition to.

These objects may be drives, [logical disks](#), or images. Check that the objects are correctly placed.

▣ Object control buttons

Locate	Click this button to locate the selected object in the Drives panel.
Add Empty Space/Add Missing Drive	Click this button to add an empty space or missing drive object to the RAID
Remove	Click this button to remove the selected object from the RAID
Move Up	Click this button to move up the selected object in the RAID
Move Down	Click this button to move down the selected object in the RAID
Synchronize Offsets	Click this button to make the offsets the same for all objects in the RAID
Reset changes	Click this button to return the configuration to the initial state (after clicking the Apply button or immediately after loading)

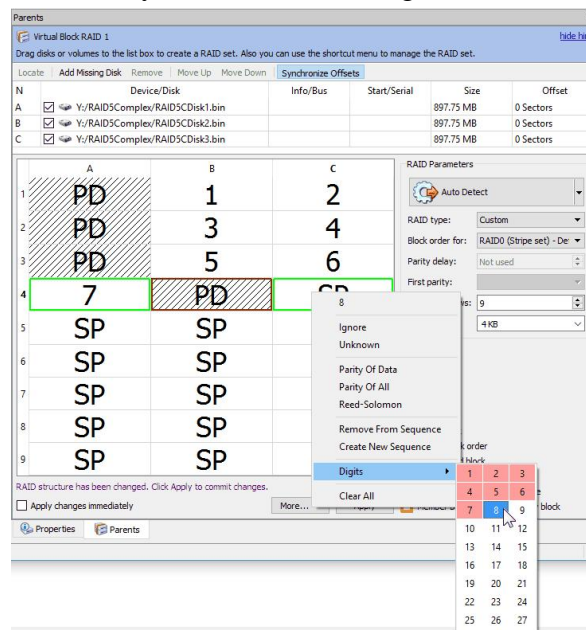

- 3 **Specify the Block size and Offset parameters on the Parents tab**
Disregard the Block order for field.
- 4 **Manually enter 9 to Number of rows on the Parents tab**
The Block order table will expand.
- 5 **Enter the block order in the table on the Parents tab**
Use the RAID Sequence window to move from one row to another.

Sequences window

Using the keyboard: arrow keys to navigate, digit and p keys to enter the block order.

Using the mouse: right-click the cell and select the number or parity from the shortcut menu. If the block table is too large, you better use the keyboard to enter the digits.

Corrections: R-Studio will tell you if some digits are not correct. Navigate to the required cell and enter the correct value. Use the **Delete** key to clear a cell.

Clear the table: Right-click the table and select **Clear all** on the shortcut menu.

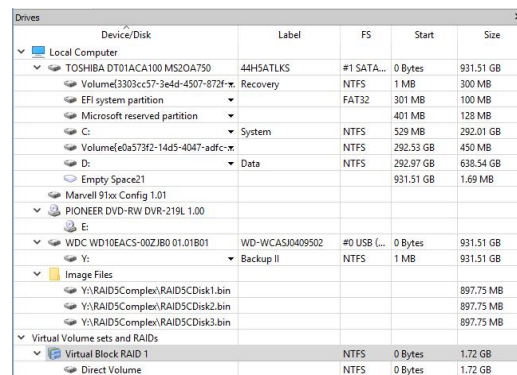

6 When you finishes entering the information, click the **Apply** button on the Parents tab

> The created Virtual Block RAID 1 object can now be processed like regular drives/volumes

If R-Studio detects a valid file system on this RAID object, a [partition](#) object will appear in the Drives panel.

The [Description Files for RAID Configurations](#) topic shows the RAID description file for this RAID configuration.

You also may check the RAID consistency, if necessary. See the [Checking RAID Consistency](#) help page for details.

Advanced RAID 5

Another example is a RAID with the following layout, similar to that used in Mac Pro internal RAID cards with 4 drives.

- Four drives,
- Block size: 512 KB (1024 sectors)
- Offset: 32768 sectors (64 KB)
- Block order:

Sequence 1			Sequence 2			Sequence 3			Sequence 4		
A	B	C	D	A	B	C	D	A	B	C	D
PD	1	2	PD	3	4	PD	5	6	PD	7	8

As you see, this layout cannot be fit directly into a standard 2D block order table. Still, it's possible to create such RAID layout using the RAID Sequence window.

To create such RAID,

- 1 **Click the Create virtual volume sets or RAID's button and select Create Virtual Block RAID & Autodetect** or select **Create Virtual Block RAID & Autodetect** on the **Create** menu
Check that the Apply changes immediately check box is clear on the Parents tab. This will prevent **R-Studio** from trying to start processing the RAID configuration until you specify it completely.
- 2 **Drag the required objects from the Drives pane to the Parents tab and select Custom on the RAID type**
 - ▣ **Other ways to add objects**
 - Right-click the Parents tab and select the required partition from the shortcut menu,
or
 - Right-click the partition in the Drives panel, select **Add to RAID** on the shortcut menu, and select the RAID object you want to add the partition to.

These objects may be drives, logical disks, or images. Check that the objects are correctly placed.

▣ Object control buttons

Locate	Click this button to locate the selected object in the Drives panel.
Add Empty Space/Add Missing Drive	Click this button to add an empty space or missing drive object to the RAID
Remove	Click this button to remove the selected object from the RAID
Move Up	Click this button to move up the selected object in the RAID
Move Down	Click this button to move down the selected object in the RAID
Synchronize Offsets	Click this button to make the offsets the same for all objects in the RAID
Reset changes	Click this button to return the configuration to the initial state (after clicking the Apply button or immediately after loading)

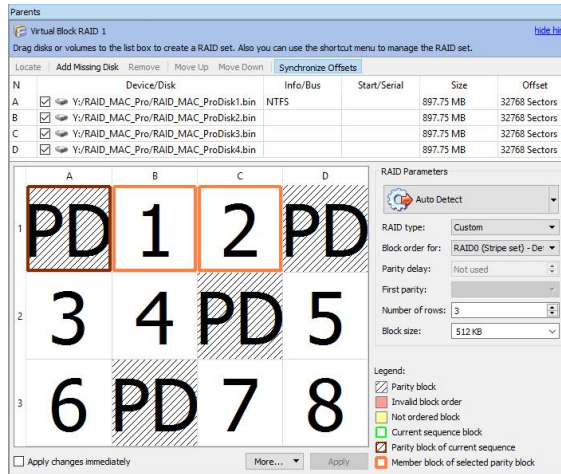

Device/Disk	Label	FS	Start	Size

Virtual Volume sets and RAIDs				
Virtual Block RAID 1				

- 3 **Specify the Block size and Offset parameters on the Parents tab**
Disregard the Block order field.
- 4 **Manually enter 3 to Number of rows on the Parents tab and change Block order to Custom**
- 5 **Right-click the RAID Sequence window and select Remove All. Manually enter 3 to Number of rows on the Parents tab**
- 6 **Right-click Cell 1 in the block order table and select Create New Sequence.**
- 7 **Right-click Cell 2 in the block order table and select Add to Sequence, do that for Cell 3, too.**
- 8 **Right-click Cell 4 in the block order table and select Create New Sequence.**
- 9 **Right-click Cell 5 in the block order table and select Add to Sequence, do that for Cell 6, too.**
Continue those steps for the rest of the table until the RAID Sequence window will have 4 sequences of 3 drives:

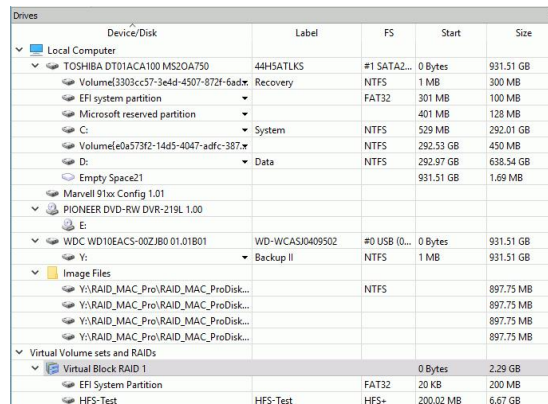

Sequences window

Sequence
A1 B1 C1
D1 A2 B2
C2 D2 A3
B3 C3 D3

- 10 **Select the first line in the RAID Sequence window, right-click Cell 1 in the block order table, and select Parity of Data.**
If any unnecessary sequences appear, right-click them in the RAID Sequence window, and select Remove.
- 11 **Right-click Cell 2 in the block order table and select 1, do that for Cell 3 selecting 2.**
If any unnecessary sequences appear, right-click them in the RAID Sequence window, and select Remove.
- 12 **Move to the next sequence in the RAID Sequence window and repeat the procedure for cells 4, 5, and 6.**
Do that for the rest of the sequences until you fill all cells in the block order table in the Parents tab.

- > The created Virtual Block RAID 1 object can now be processed like regular drives/volumes. If **R-Studio** detects a valid file system on this RAID object, a partition object will appear in the Drives panel. The [Description Files for RAID Configurations](#) topic shows the RAID description file for this RAID configuration.

You also may check the RAID consistency, if necessary. See the [Checking RAID Consistency](#) help page for details.

Advanced RAID 6 Layout

For example, let us create a RAID 6 with the following layout:

- Five drives,
- Block size: 64 KB
- Offset: 0
- Block order:

	A	B	C	D	E
1	RS	1	2	3	PD
2	4	5	6	PD	RS
3	8	9	PD	RS	7
4	12	PD	RS	10	11
5	PD	RS	13	14	15

6	PA	PA	PA	PA	PA
---	----	----	----	----	----

where

PD is parity of data;

PA is parity of all;

RS is Reed-Solomon;

Rows from 1 to 5 use two types of error correction: parity of data (xor) and Reed-Solomon. That is, row 1 uses blocks A1 and E1, row 2 uses blocks D2 and E2, and so on.

Row 6 is used for error correction for columns. That is, column A uses block A6, column B uses B6, and so on. Parity of all is used for error correction.

- 1 **Click the Create virtual volume sets or RAIDs button and select Create Virtual Block RAID & Autodetect** or select **Create Virtual Block RAID & Autodetect** on the **Create** menu

Check that the Apply changes immediately check box is clear on the Parents tab. This will prevent **R-Studio** from trying to start processing the RAID configuration until you specify it completely.

- 2 **Drag the required objects from the Drives pane to the Parents tab and select Custom on the RAID type**

Other ways to add objects

- Right-click the Parents tab and select the required partition from the shortcut menu, or
- Right-click the partition in the Drives panel, select **Add to RAID** on the shortcut menu, and select the RAID object you want to add the partition to.

These objects may be drives, logical disks, or images. Check that the objects are correctly placed.

Object control buttons

Locate	Click this button to locate the selected object in the Drives panel.
Add Empty Space/Add Missing Drive	Click this button to add an empty space or missing drive object to the RAID
Remove	Click this button to remove the selected object from the RAID
Move Up	Click this button to move up the selected object in the RAID
Move Down	Click this button to move down the selected object in the RAID
Synchronize Offsets	Click this button to make the offsets the same for all objects in the RAID
Reset changes	Click this button to return the configuration to the initial state (after clicking the Apply button or immediately after loading)

Device/Disk	Label	FS	Start	Size
TOSHIBA DT01ACA100 MS20A750	44H5ATLKS	#1 SATA2...	0 Bytes	931.51 GB

Y:\RAID6Complex\img5.bin				897.75 MB
Virtual Volume sets and RAID:				
Virtual Block RAID 1				

3 Specify the Block size and Offset parameters on the Parents tab

Disregard the Block order parameter.

4 Manually enter 6 to Number of rows on the Parents tab

5 Enter the block order in the table on the Parents tab

You may enter either a block number, or an error correction block of the following types:

PD	Parity of data
PA	Parity of all
RS	Reed-Solomon
SP	Spare Part
I	Ignore

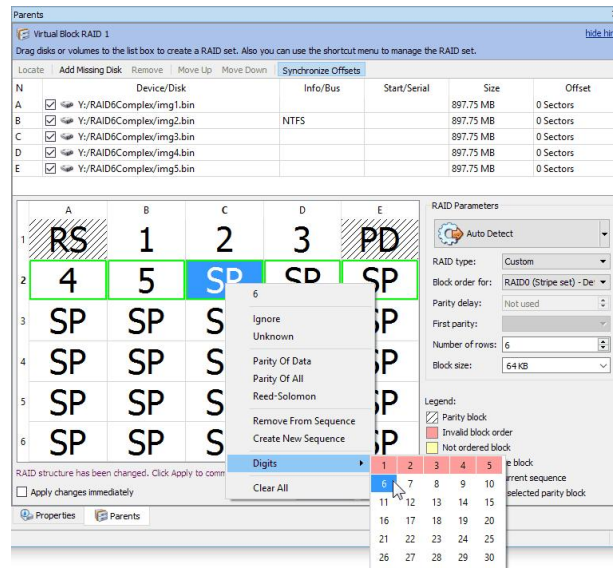

Note: You should specify an error correction block only when the correct sequence is selected on the RAID Sequences window.

Sequences window

Sequence
A1 B1 C1 D1 E1
A2 B2 C2 D2 E2
A3 B3 C3 D3 E3
A4 B4 C4 D4 E4
A5 B5 C5 D5 E5
A6 B6 C6 D6 E6
A1 A2 A3 A4 A5 A6
B1 B2 B3 B4 B5 B6
C1 C2 C3 C4 C5 C6
D1 D2 D3 D4 D5 D6
E1 E2 E3 E4 E5 E6

Using the keyboard: arrow keys to navigate, digit, and rs, pd, pa, u, i keys to enter the block order.

Using the mouse: right-click the cell and select the number or parity from the shortcut menu. If the block table is too large, you better use the keyboard to enter the digits.

For the rows:

Select the required row sequence on the RAID Sequences window, select the cell on the RAID table, and enter the required value. **R-Studio** automatically generates those sequences when you add RAID parents.

For the columns and arbitrary sequences:

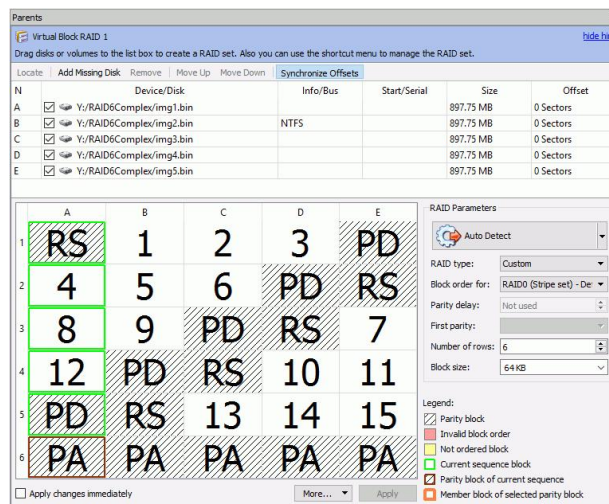

You need to create those sequences and add the respective blocks to it manually.

To create a sequence: Click **Add empty** on the RAID Sequences window or select **Create New Sequence** on the shortcut menu on the Parents tab.

To add a block to a sequence: Right-click the respective cell and select **Add To Sequence** on the shortcut menu on the Parents tab.

To remove a block to a sequence: Right-click the respective cell and select **Remove From Sequence** on the shortcut menu on the Parents tab.

6 When you finishes entering the information, click the Apply button on the Parents tab

> The created Virtual Block RAID 1 object can now be processed like regular drives/volumes

If **R-Studio** detects a valid file system on this RAID object, a partition object will appear in the Drives panel.

The [Description Files for RAID Configurations](#) topic shows the RAID description file for this RAID configuration.

Device/Disk	Label	FS	Start	Size

You also may check the RAID consistency, if necessary. See the [Checking RAID Consistency](#) help page for details.

2.4.7 Nested and Non-Standard RAID Levels

R-Studio can work with various [nested and non-standard RAID levels](#). Currently, the following RAID levels are supported:

- [RAID10 \(1+0\)](#)
- [RAID1E](#)
- [RAID5E](#)
- [RAID5EE](#)
- [RAID6E](#)

2.4.7.1 RAID10 (1+0)

A RAID 10 (or 1+0) is a stripe of mirrors. Its block order can be represented as:

	A	B	C	D
1	1	1	2	2

To create a RAID 10 object

- 1 Click the **Create Virtual RAID** button and select **Create Virtual Block RAID & Autodetect** or select the **Create Virtual Block RAID & Autodetect** on the **Create** menu
- > A **Virtual Block RAID** object will appear in the **Drives** panel

Device/Disk	Label	FS	Start	Size

2 Drag the required partitions from the Drives panel to the Parents tab

▣ Other ways to add objects

- Right-click the Parents tab and select the required partition from the shortcut menu, or
- Right-click the partition in the Drives panel, select **Add to RAID** on the shortcut menu, and select the RAID object you want to add the partition to.

3 Select RAID 10 on the RAID type

You may either make **R-Studio** to process your changes immediately or wait until you finish editing the RAID layout. Select or clear the Apply changes immediately checkbox on the Parents tab. Click the **Apply** button to apply the changes when are you through.

Note: Objects should be placed in the same order as they were in the original RAID 10. If this order is incorrect, you must change it by dragging the parents to place them in the correct order.

▣ Object control buttons

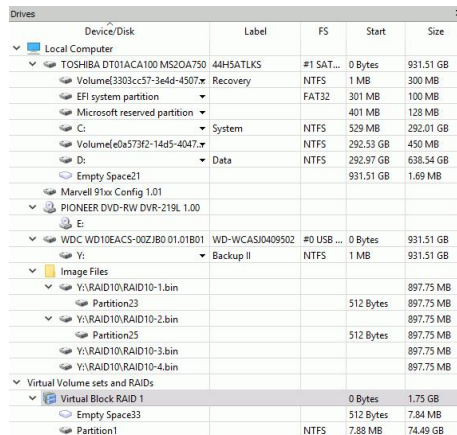

Locate	Click this button to locate the selected object in the Drives panel.
Add Empty Space/Add Missing Drive	Click this button to add an empty space or missing drive object to the RAID
Remove	Click this button to remove the selected object from the RAID
Move Up	Click this button to move up the selected object in the RAID
Move Down	Click this button to move down the selected object in the RAID
Synchronize Offsets	Click this button to make the offsets the same for all objects in the RAID
Reset changes	Click this button to return the configuration to the initial state (after clicking the Apply button or immediately after loading)

The RAID block size and Offset (in sectors) parameters must be set the same as for the original RAID 10.

You also need to specify Block order for virtual RAID 10. You may select it on the Block order drop-down or shortcut menu.

If the those parameters are not correct, data on the parents will not be damaged, but files from the RAID 10 cannot be recovered.

Note: You may check how correctly you have reconstructed the original RAID 10. Find a file and preview it. If the file appears correct, you have created a correct RAID 10 layout.

Parents tab

> The RAID 10 object can now be processed like regular drives/volumes

If R-Studio detects a valid file system on the newly created RAID object, a [partition](#) object will appear in the Drives panel.

The [Description Files for RAID Configurations](#) topic shows the RAID description file for this RAID configuration.

You also may check the RAID consistency, if necessary. See the [Checking RAID Consistency](#) help page for details.

2.4.7.2 RAID1E

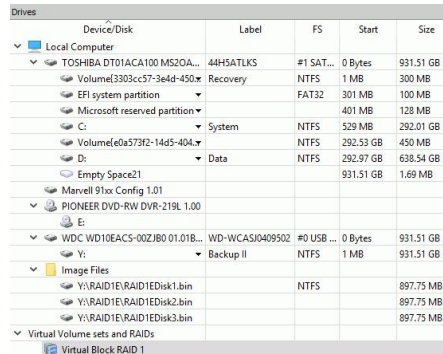

RAID 1E utilizes both the mirroring and striping: data is striped across all drives, as in RAID 0. Additionally, a copy of each stripe is stored on a different drive, as in RAID 1. Its block order can be represented as:

	A	B	C
1	1	1	2
2	2	3	3

To create a RAID 1E object

- 1 Click the Create Virtual RAID button and select Create Virtual Block RAID & Autodetect or select the Create Virtual Block RAID & Autodetect on the Create menu

> **A Virtual Block RAID object will appear in the Drives panel**

2 Drag the required partitions from the Drives panel to the Parents tab

Other ways to add objects

- Right-click the Parents tab and select the required partition from the shortcut menu, or
- Right-click the partition in the Drives panel, select **Add to RAID** on the shortcut menu, and select the RAID object you want to add the partition to.

3 Select RAID 1E on the RAID type

You may either make **R-Studio** to process your changes immediately or wait until you finish editing the RAID layout. Select or clear the Apply changes immediately checkbox on the Parents tab. Click the **Apply** button to apply the changes when are you through.

Note: Objects should be placed in the same order as they were in the original RAID 1E. If this order is incorrect, you must change it by dragging the parents to place them in the correct order.

Object control buttons

Locate	Click this button to locate the selected object in the Drives panel.
Add Empty Space/Add Missing Drive	Click this button to add an empty space or missing drive object to the RAID
Remove	Click this button to remove the selected object from the RAID
Move Up	Click this button to move up the selected object in the RAID
Move Down	Click this button to move down the selected object in the RAID
Synchronize Offsets	Click this button to make the offsets the same for all objects in the RAID
Reset changes	Click this button to return the configuration to the initial state (after clicking the Apply button or immediately after loading)

The RAID block size and Offset (in sectors) parameters must be set the same as for the original RAID 1E.

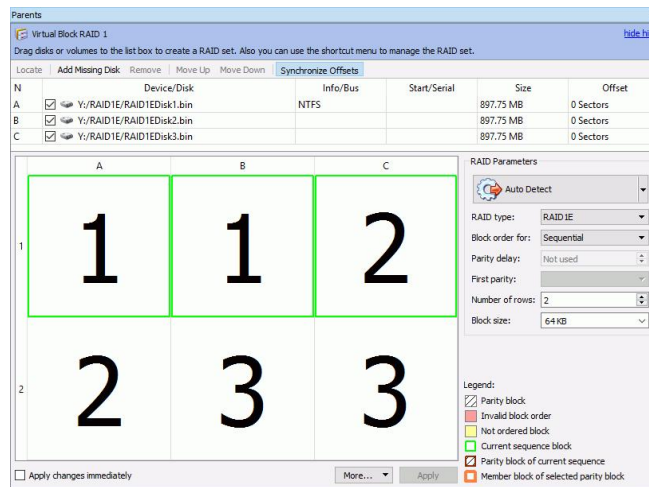

You also need to specify Block order for virtual RAID 1E You may select it on the Block order drop-down or shortcut menu.

If the those parameters are not correct, data on the parents will not be damaged, but files from the RAID 1E cannot be recovered.

Note: You may check how correctly you have reconstructed the original RAID 1E. Find a file and preview it. If the file appears correct, you have created a correct RAID 1E layout.

Parents tab

> The **RAID 1E** object can now be processed like regular drives/volumes

If **R-Studio** detects a valid file system on the newly created RAID object, a [partition](#) object will appear in the Drives panel.

The [Description Files for RAID Configurations](#) topic shows the RAID description file for this RAID configuration.

You also may check the RAID consistency, if necessary. See the [Checking RAID Consistency](#) help page for details.

2.4.7.3 RAID5E

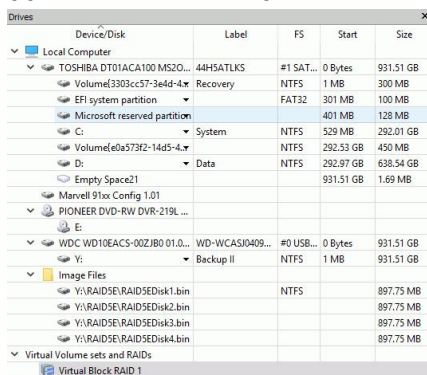

RAID 5E (where E stands for Enhanced) is a RAID 5 layout with an integrated hot-spare drive, where the spare drive is an active part of the block rotation scheme. An example of such RAID layout is in the table below:

	A	B	C	D
1	1	2	3	PD
2	5	6	PD	4
3	9	PD	7	8
4	PD	10	11	12
5	SP	SP	SP	SP

where PD and SP stand for Parity of Data and Spare Part.

To create a RAID 5E object

- 1 Click the **Create Virtual RAID** button and select **Create Virtual Block RAID & Autodetect** or select the **Create Virtual Block RAID & Autodetect** on the **Create** menu
- > A **Virtual Block RAID** object will appear in the **Drives** panel

- 2 Drag the required partitions from the **Drives** panel to the **Parents** tab

Other ways to add objects

- Right-click the **Parents** tab and select the required partition from the shortcut menu, or
- Right-click the partition in the **Drives** panel, select **Add to RAID** on the shortcut menu, and select the RAID object you want to add the partition to.

- 3 Select **RAID 5E** on the **RAID** type

You may either make **R-Studio** to process your changes immediately or wait until you finish editing the RAID layout. Select or clear the **Apply changes immediately** checkbox on the **Parents** tab. Click the **Apply** button to apply the changes when are you through.

Note: Objects should be placed in the same order as they were in the original RAID 5E. If this order is incorrect, you must change it by dragging the parents to place them in the correct order.

Object control buttons

Locate	Click this button to locate the selected object in the Drives panel.
Add Empty Space/Add Missing Drive	Click this button to add an empty space or missing drive object to the RAID
Remove	Click this button to remove the selected object from the RAID
Move Up	Click this button to move up the selected object in the RAID
Move Down	Click this button to move down the selected object in the RAID
Synchronize Offsets	Click this button to make the offsets the same for all objects in the RAID
Reset changes	Click this button to return the configuration to the initial state (after clicking the Apply button or immediately after loading)

The RAID block size and Offset (in sectors) parameters must be set the same as for the original RAID 5E.

You also need to specify Block order for virtual RAID 5E You may select it on the Block order drop-down or shortcut menu.

If the those parameters are not correct, data on the parents will not be damaged, but files from the RAID 5E cannot be recovered.

Note: You may check how correctly you have reconstructed the original RAID 5E. Find a file and preview it. If the file appears correct, you have created a correct RAID 5E layout.

Parents tab

> **The RAID 5E object can now be processed like regular drives/volumes**

If **R-Studio** detects a valid file system on the newly created RAID object, a [partition](#) object will appear in the Drives panel.

The [Description Files for RAID Configurations](#) topic shows the RAID description file for this RAID configuration.

You also may check the RAID consistency, if necessary. See the [Checking RAID Consistency](#) help page for details.

2.4.7.4 RAID5EE

RAID 5EE (where E stands for Enhanced) is a RAID 5 layout with an integrated hot-spare drive, where the spare drive is an active part of the block rotation scheme. An example of such RAID layout is in the table below:

	A	B	C	D
1	1	2	SP	PD
2	4	SP	PD	3

3	SP	PD	5	6
4	PD	7	8	SP

where PD and SP stand for Parity of Data and Spare Part.

To create a RAID 5EE object

- 1 Click the **Create Virtual RAID** button and select **Create Virtual Block RAID & Autodetect** or select the **Create Virtual Block RAID & Autodetect** on the **Create** menu
- > A **Virtual Block RAID** object will appear in the **Drives** panel

- 2 Drag the required partitions from the **Drives** panel to the **Parents** tab

Other ways to add objects

- Right-click the **Parents** tab and select the required partition from the shortcut menu, or
- Right-click the partition in the **Drives** panel, select **Add to RAID** on the shortcut menu, and select the RAID object you want to add the partition to.

- 3 Select **RAID 5EE** on the **RAID** type

You may either make **R-Studio** to process your changes immediately or wait until you finish editing the RAID layout. Select or clear the **Apply changes immediately** checkbox on the **Parents** tab. Click the **Apply** button to apply the changes when are you through.

Note: Objects should be placed in the same order as they were in the original RAID 5EE. If this order is incorrect, you must change it by dragging the parents to place them in the correct order.

Object control buttons

Locate	Click this button to locate the selected object in the Drives panel.
Add Empty Space/Add Missing Drive	Click this button to add an empty space or missing drive object to the RAID
Remove	Click this button to remove the selected object from the RAID
Move Up	Click this button to move up the selected object in the RAID
Move Down	Click this button to move down the selected object in the RAID
Synchronize Offsets	Click this button to make the offsets the same for all objects in the RAID
Reset changes	Click this button to return the configuration to the initial state (after clicking the Apply button or immediately after loading)

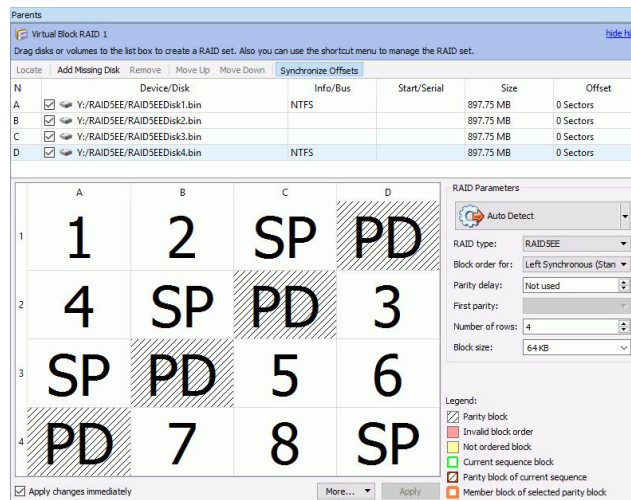

The RAID block size and Offset (in sectors) parameters must be set the same as for the original RAID 5EE. You also need to specify Block order for virtual RAID 5EE. You may select it on the Block order drop-down or shortcut menu.

If those parameters are not correct, data on the parents will not be damaged, but files from the RAID 5EE cannot be recovered.

Note: You may check how correctly you have reconstructed the original RAID 5EE. Find a file and preview it. If the file appears correct, you have created a correct RAID 5EE layout.

Parents tab

> The RAID 5EE object can now be processed like regular drives/volumes

If R-Studio detects a valid file system on the newly created RAID object, a [partition](#) object will appear in the Drives panel.

The [Description Files for RAID Configurations](#) topic shows the RAID description file for this RAID configuration.

You also may check the RAID consistency, if necessary. See the [Checking RAID Consistency](#) help page for details.

2.4.7.5 RAID6E

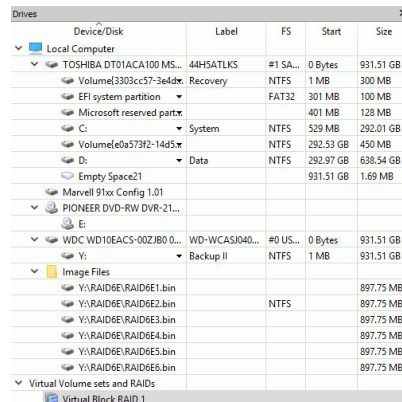

RAID 6E (where E stands for Enhanced) is a RAID 6 layout with an integrated hot-spare drive, where the spare drive is an active part of the block rotation scheme. An example of such RAID layout is in the table below:

	A	B	C	D	E	F
1	RS	1	2	3	4	PD
2	5	6	7	8	PD	RS
3	10	11	12	PD	RS	9
4	15	16	PD	RS	13	14
5	20	PD	RS	17	18	19
6	PD	RS	21	22	23	24
7	SP	SP	SP	SP	SP	SP

where RS, PD and SP stand for Reed-Solomon, Parity of Data, and Spare Part, respectively.

To create a RAID 6E object

- 1 Click the **Create Virtual RAID** button and select **Create Virtual Block RAID & Autodetect** or select the **Create Virtual Block RAID & Autodetect** on the **Create** menu
- > A **Virtual Block RAID** object will appear in the **Drives** panel

- 2 Drag the required partitions from the **Drives** panel to the **Parents** tab

Other ways to add objects

- Right-click the **Parents** tab and select the required partition from the shortcut menu, or
- Right-click the partition in the **Drives** panel, select **Add to RAID** on the shortcut menu, and select the RAID object you want to add the partition to.

- 3 Select **RAID 6E** on the **RAID** type

You may either make **R-Studio** to process your changes immediately or wait until you finish editing the RAID layout. Select or clear the **Apply changes immediately** checkbox on the **Parents** tab. Click the **Apply** button to apply the changes when are you through.

Note: Objects should be placed in the same order as they were in the original RAID 6E. If this order is incorrect, you must change it by dragging the parents to place them in the correct order.

Object control buttons

Locate	Click this button to locate the selected object in the Drives panel.
Add Empty Space/Add Missing Drive	Click this button to add an empty space or missing drive object to the RAID

Remove	Click this button to remove the selected object from the RAID
Move Up	Click this button to move up the selected object in the RAID
Move Down	Click this button to move down the selected object in the RAID
Synchronize Offsets	Click this button to make the offsets the same for all objects in the RAID
Reset changes	Click this button to return the configuration to the initial state (after clicking the Apply button or immediately after loading)

The RAID block size and Offset (in sectors) parameters must be set the same as for the original RAID 6E. You also need to specify Block order for virtual RAID 6E You may select it on the Block order drop-down or shortcut menu.

If the those parameters are not correct, data on the parents will not be damaged, but files from the RAID 6E cannot be recovered.

Note: You may check how correctly you have reconstructed the original RAID 6E. Find a file and preview it. If the file appears correct, you have created a correct RAID 6E layout.

Parents tab

> **The RAID 6E object can now be processed like regular drives/volumes**

If **R-Studio** detects a valid file system on the newly created RAID object, a [partition](#) object will appear in the Drives panel.

The [Description Files for RAID Configurations](#) topic shows the RAID description file for this RAID configuration.

You also may check the RAID consistency, if necessary. See the [Checking RAID Consistency](#) help page for details.

2.4.8 Finding RAID Parameters

R-Studio can find parameters for RAID 5 and 6. RAID parameters can be found automatically or manually.

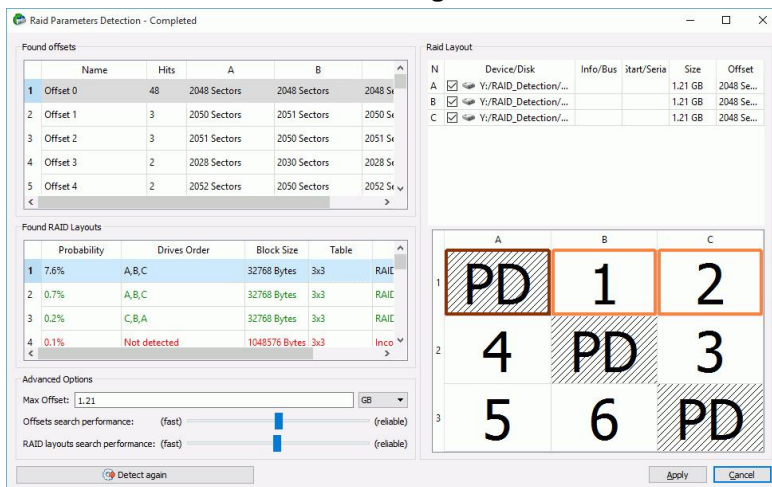

The number of drives in the RAID should be between 3 and 32. RAID parameters can be found only when all original drives (or their images) are present. Even one substitute object in a RAID (like a missing drive) makes finding RAID parameters impossible.

To find RAID parameters automatically,

1 **Click the Auto Detect button on the Parents tab**

> **R-Studio will start searching for the RAID parameters and show the most probable one on the RAID Parameter Detection dialog box**

RAID Parameter Detection dialog box

2 **Click the Apply button and R-Studio will change the RAID layout to the selected one on the Parents tab.**

3 **Click the Apply button on the Parents tab**

> **R-Studio will use the found parameters for the RAID.**

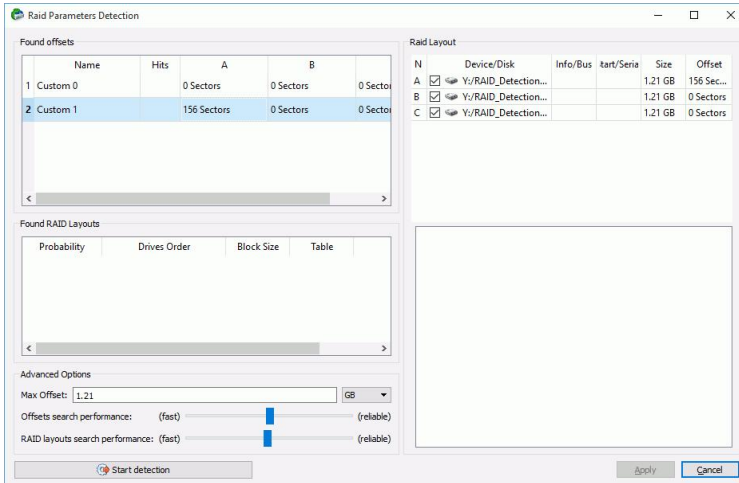

If necessary, you may return to the RAID Parameter Detection dialog box by clicking the **Choose Variants** button, and select another RAID layout.

To find RAID parameters manually,

1 **Click the drop-down Auto Detect list on the Parents tab and select Advanced Detection.**

- Specify the necessary detection parameters on the RAID Parameter Detection dialog box and click the Start detection button

RAID Parameters Detection dialog box

You may change the drive order, offset for drive(s), and enable/disable drives.

Advanced Parameters

Max offset:	The area on the drive to find RAID parameters in.
Offset search performance RAID layouts search performance	Cumulative parameters that estimates the probability of certain found RAID parameters. Moving it to the right increases accuracy but slows the process. Moving it to the left reduces the accuracy but makes the process faster.

You may add your own RAID offsets. Right-click empty space in the **Found offsets** pane and select **Add Custom offset** on the shortcut menu and specify the offset individually for every drive.

- Select an offset and click the Click here to find RAID Layouts button on the RAID Parameters Detection dialog box

RAID Parameters Detection dialog box

- Select a RAID variant in the Found RAID layouts pane and click the Apply button
- Click the Apply button on the Parents tab

> **R-Studio will use the found parameters for the RAID.**

If necessary, you may return to the RAID Parameter Detection dialog box by clicking the **Choose Variants** button, and select another RAID layout.

2.4.9 Checking RAID Consistency

You may check RAID consistency (whether the data parity values are valid) for RAID layouts with parity blocks.

To check RAID consistency,

* **Right-click the RAID and select Check RAID consistency... on the shortcut menu**

> **The RAID consistency check window will appear showing the progress.**

RAID consistency check **window**

When the check is finished, you may inspect the results.

Block color	
Green	Data parity values are valid.
Red	Data parity values are not valid.
White	0's

When a mouse pointer hovers over a block, a tooltip will show the sector range within the block and number of consistent and inconsistent sectors. Double-clicking the block moves it to the upper-leftmost corner and zooms in the data by 2.

RAID consistency check controls

Sectors	The number of the first sector in the row.
Offset	Offset in the data. Enter the address you want to jump to and press the Enter key.
Sectors/Bytes/KB...	Specifies the dimension of the data in the Offset field.
Previous/Next	Moves to the previous/next part of the data.
+/?	Zooms into/out of, the data.

2.4.10 Syntax of a Description File for RAID Configurations

You may create and store your own RAID configurations. The syntax of those files is similar to that of the XML language. They are stored in an `.xml` file specified on the [R-Studio Settings](#).

A number of file examples are shown on the [Description Files for RAID Configurations](#) topic.

There are two types of such description files: for RAID presets and custom-created RAID layouts.

RAID preset configuration file

```
<?xml version="1.0" encoding="UTF-8"?>
<RAIDList version="1">
  <RAID blockSize="65536" name="RAID5" rows="3" type="5" order="2"
parityDelay="1">
    <Parents>
      <Parent comp="RAID5Disk1.dsk" name="Promise1+0 JBOD1.10"
size="40060321792" order="1"/>
      <Parent comp="RAID5Disk2.dsk" name="Promise1+0 JBOD1.10"
size="40060321792" order="2"/>
      <Parent comp="RAID5Disk3.dsk" name="Promise1+0 JBOD1.10"
size="40060321792" order="3"/>
    </Parents>
  </RAID>
</RAIDList>
```

Custom-created RAID configuration file example

```
<?xml version="1.0" encoding="UTF-8"?>
<RAIDList version="1">
  <RAID blockSize="65536" name="RAID6Complex" rows="6" type="256">
    <Parents>
      <Parent name="img1.bin" size="941359104" order="1"/>
      <Parent name="img2.bin" fs="NTFS" size="941359104" order="2"/>
      <Parent name="img3.bin" size="941359104" order="3"/>
      <Parent name="img4.bin" size="941359104" order="4"/>
      <Parent name="img5.bin" size="941359104" order="5"/>
    </Parents>
    <Table>
      <Block id="A1">ReedSolomon</Block>
      <Block id="B1">1</Block>
      <Block id="C1">2</Block>
      <Block id="D1">3</Block>
      <Block id="E1">XorOfData</Block>
      <Block id="A2">4</Block>
      <Block id="B2">5</Block>
      <Block id="C2">6</Block>
      <Block id="D2">XorOfData</Block>
      <Block id="E2">ReedSolomon</Block>
      <Block id="A3">8</Block>
      <Block id="B3">9</Block>
      <Block id="C3">XorOfData</Block>
      <Block id="D3">ReedSolomon</Block>
      <Block id="E3">7</Block>
      <Block id="A4">12</Block>
      <Block id="B4">XorOfData</Block>
      <Block id="C4">ReedSolomon</Block>
      <Block id="D4">10</Block>
      <Block id="E4">11</Block>
      <Block id="A5">XorOfData</Block>
      <Block id="B5">ReedSolomon</Block>
      <Block id="C5">13</Block>
      <Block id="D5">14</Block>
```

```

        <Block id="E5">15</Block>
        <Block id="A6" sequence="1">XorOfAll</Block>
        <Block id="B6" sequence="2">XorOfAll</Block>
        <Block id="C6" sequence="3">XorOfAll</Block>
        <Block id="D6" sequence="4">XorOfAll</Block>
        <Block id="E6" sequence="5">XorOfAll</Block>
    </Table>
    <Sequences>
        <Sequence id="1">A1 A2 A3 A4 A5 A6</Sequence>
        <Sequence id="2">B1 B2 B3 B4 B5 B6</Sequence>
        <Sequence id="3">C1 C2 C3 C4 C5 C6</Sequence>
        <Sequence id="4">D1 D2 D3 D4 D5 D6</Sequence>
        <Sequence id="5">E1 E2 E3 E4 E5 E6</Sequence>
    </Sequences>
</RAID>
</RAIDList>

```

File structure

File header

The file starts with a standard XML header:

```
<?xml version="1.0" encoding="utf-8"?>
```

Section RAIDList

```
<RAIDList>
```

It can contain any number of the <RAID> sections and requires a closing element </FileTypeList>.

Section structure example:

```

<RAIDList>
    <RAID [attributes]>
        ...
    </RAID>
    ...
    <RAID [attributes]>
        ...
    </RAID>

```

Section RAID

This section describes each RAID layout.

It must contain at least one <Table> and <Parents> sections and can contain one block <Sequences>..

```

<RAIDList version="1">
    <RAID blockSize="65536" name="RAID5" rows="3" type="5" order="2"
parityDelay="1">
        <Parents>

            </Parents>
        <Table>

            </Table>
        <Sequences>

            </Sequences>
    </RAID>
</RAIDList>

```

Attributes:

blocksize	<u32>	Required	The block size of the RAID in bytes
name	<string>	Optional	The name of the RAID layout
rows	<u16>	Required	The number of rows in the RAID layout table.
type	<u16>	Required	The type of the RAID preset. The following types are supported: 1: RAID0 (Stripe set) 2: RAID10 3: RAID1E 4: RAID4 5: RAID5 6: RAID5E 7: RAID5EE 8: RAID6 / Reed-Solomon Encoding 9: RAID6E / Reed-Solomon Encoding 10: RAID6 / Vertical Xor Encoding 256: Custom Raid Table If the RAID type parameter contradicts to the RAID table, the RAID table always prevails.
order	<u16>	Required/Optional	The RAID sub-type. For example, order="2" means Left Asynchronous for RAID5 layouts. Any value for the custom RAID layouts will be ignored.
parityDelay	<u16>	Required	The Parity delay parameter.

Section structure example:

```
<RAID blockSize="65536" rows="6" type="256">
  <Parents>

  </Parents>

  <Table>

  </Table>
  <Sequences>

  </Sequences>
</RAID>
```

Section Parents

This section describes the RAID parents. It contains the <Parent> elements of the RAID.

Section structure example:

```
<Parents>
  <Parent comp="RAID5Disk1.dsk" name="Promise1+0 JBOD1.10"
size="40060321792" order="1"/>
  <Parent comp="RAID5Disk2.dsk" name="Promise1+0 JBOD1.10"
size="40060321792" order="2"/>
</Parents>
```

```

        <Parent comp="RAID5Disk3.dsk" name="Promise1+0 JBOD1.10"
size="40060321792" order="3"/>
    </Parents>

```

Element Parent

The element specifies the parent of the RAID.

Attributes:

comp	<string>	Required/O ptional	The file-container with the parent object.
name	<string>	Required	The object name of the RAID parent.
offset	<u16>	Required is not 0	The offset value in bytes
size=	<u16>	Required	The object size in bytes
order	<u16>	Required	The order of the RAID object

Section Table

This section describes the RAID layout table. It contains the <Block> elements which number is a product of two attributes in the <RAID> section: <parents> x <rows>.

Section structure example:

```

<RAIDList>
  <RAID name="example" parents="2" rows="2" blocksize="16777216">
    <Table>
      <Block [attributes]> ... </Block>
      <Block [attributes]> ... </Block>
      <Block [attributes]> ... </Block>
      <Block [attributes]> ... </Block>
    </Table>
  </RAID>
</RAIDList>

```

Element Block

The element specifies the block number in the RAID layout table (a positive integer number) or an error correction block of the following types:

- PD Or ParityOfData
- PA Or ParityOfAll
- RS Or ReedSolomon
- U Or Unknown
- I Or Ignore

Any other value is treated as Unknown.

Attributes:

id	<string>	Required	The alpha-numerical identifier of the block in the RAID layout table. The element in the 3-rd column of the 2-nd line is designated as C2. AA is used after letter z, and so on.
sequence	<string>	Optional	The numerical identifier for non-default sequences.

Section Sequences

This section describes the non-default data checksum sequences used to preserve data integrity. It is not necessary to explicitly list default sequences (the table rows). Sequences can contain any number of the <Sequence> elements.

Section structure example:

```
<RAIDList>
  <RAID name="example" parents="4" rows="4" blocksize="16777216">
    <Parents>

    </Parents>
    <Table>
      ...
    </Table>
    <Sequences>
      <Sequence [attributes]> ... </Sequence>
      ...
      <Sequence [attributes]> ... </Sequence>
    </Sequences>
  </RAID>
</RAIDList>
```

Element Sequence

The element contains the list of the RAID blocks belonging to that sequence. The elements are separated by a space .

Attributes:

id	<u16>	Required	The sequence identifier.
----	-------	----------	--------------------------

Element example:

See the [RAID configuration file example](#).

Comments

```
<!-- Comment string -->

An XML standard string for a comment.

2.4.11 Description Files for RAID Configurations

Below are description files for RAID examples described in the [Volume Sets and RAIDs](#) chapter. The syntax of them is described in the [Syntax of a Description File for RAID Configurations](#) topic.

StripeSet

The stripe set layout is described in the [Volume Sets, Stripe Sets, and Mirrors](#) topic.

```
<?xml version="1.0" encoding="UTF-8"?>
<RAIDList version="1">
  <RAID blockSize="65536" name="StripeSet" rows="2" type="1" order="7"
parityDelay="1">
  <Parents>
    <Parent comp="RAID0Disk1.dsk" name="Promise1+0 JBOD1.10"
size="40060321792" order="1"/>
    <Parent comp="RAID0Disk2.dsk" name="Promise1+0 JBOD1.10"
size="40060321792" order="2"/>
```

```

    </Parents>
  </RAID>
</RAIDList>

```

Basic RAID 5

The RAID layout is described in the [Working with Basic RAID 4 and RAID 5 Operations](#) topic.

```

<?xml version="1.0" encoding="UTF-8"?>
<RAIDList version="1">
  <RAID blockSize="65536" name="RAID5" rows="3" type="5" order="2"
parityDelay="1">
    <Parents>
      <Parent comp="RAID5Disk1.dsk" name="Promise1+0 JBOD1.10"
size="40060321792" order="1"/>
      <Parent comp="RAID5Disk2.dsk" name="Promise1+0 JBOD1.10"
size="40060321792" order="2"/>
      <Parent comp="RAID5Disk3.dsk" name="Promise1+0 JBOD1.10"
size="40060321792" order="3"/>
    </Parents>
  </RAID>
</RAIDList>

```

RAID 5 with parity delays

The RAID layout is described in the [RAID5 with Parity Delays Operations](#) topic.

```

<?xml version="1.0" encoding="UTF-8"?>
<RAIDList version="1">
  <RAID blockSize="16384" name="RAID5HP" rows="48" type="5" order="2"
parityDelay="16" firstParity="16">
    <Parents>
      <Parent name="RAID5HPDisk1.bin" offset="557056" size="941359104"
order="1"/>
      <Parent name="RAID5HPDisk2.bin" offset="557056" size="941359104"
order="2"/>
      <Parent name="RAID5HPDisk3.bin" offset="557056" size="941359104"
order="3"/>
    </Parents>
  </RAID>
</RAIDList>

```

Advanced RAID 5

The RAID layout is described in the [Working with Advanced RAID Layouts](#) topic.

```

<?xml version="1.0" encoding="UTF-8"?>
<RAIDList version="1">
  <RAID blockSize="4096" name="RAID5Complex" rows="9" type="256">
    <Parents>
      <Parent name="RAID5CDisk1.bin" offset="16777216" size="941359104"
order="1"/>
      <Parent name="RAID5CDisk2.bin" offset="16777216" size="941359104"
order="2"/>
      <Parent name="RAID5CDisk3.bin" offset="16777216" size="941359104"
order="3"/>
    </Parents>
    <Table>
      <Block id="A1">XorOfData</Block>
      <Block id="B1">1</Block>
    </Table>
  </RAID>
</RAIDList>

```

```

    <Block id="C1">2</Block>
    <Block id="A2">XorOfData</Block>
    <Block id="B2">3</Block>
    <Block id="C2">4</Block>
    <Block id="A3">XorOfData</Block>
    <Block id="B3">5</Block>
    <Block id="C3">6</Block>
    <Block id="A4">7</Block>
    <Block id="B4">XorOfData</Block>
    <Block id="C4">8</Block>
    <Block id="A5">9</Block>
    <Block id="B5">XorOfData</Block>
    <Block id="C5">10</Block>
    <Block id="A6">11</Block>
    <Block id="B6">XorOfData</Block>
    <Block id="C6">12</Block>
    <Block id="A7">13</Block>
    <Block id="B7">14</Block>
    <Block id="C7">XorOfData</Block>
    <Block id="A8">15</Block>
    <Block id="B8">16</Block>
    <Block id="C8">XorOfData</Block>
    <Block id="A9">17</Block>
    <Block id="B9">18</Block>
    <Block id="C9">XorOfData</Block>
  </Table>

```

2.4.12 Various Disk and Volume Managers

R-Studio can work with objects created by various disk and volume managers. Currently, the following managers are supported:

- [BitLocker Drive Encryption](#)
- [Windows Dynamic Disks](#)
- [Windows Storage Spaces](#)
- [Apple RAIDs](#)
- [Apple CoreStorage/FileVault/Fusion Drive Volumes](#)
- [Linux mdadm RAIDs](#)
- [Linux Logical Volume Manager \(LVM and LVM2\)](#)

R-Studio can automatically recognize and add their physical components, component images, or the user can manually add the components when their data is damaged so severely that **R-Studio** cannot recognize them.

In addition, **R-Studio** can work with various [virtual disk and disk image formats](#).

2.4.12.1 BitLocker Drive Encryption

BitLocker Drive Encryption, or **BitLocker**, is a data protection feature introduced by Microsoft since Windows Vista. It implements some hard/software measures to encrypt either USB external flash drives or internal system SSD/HDD devices. You may read more about **BitLocker Drive Encryption** on the [Microsoft site](#) or [Wikipedia](#).

There are following encryption methods (protectors in the Microsoft terms) that can be utilized in the **BitLocker** protection:

- A [TPM/TPM+PIN](#) chip
- A USB key (a flash drive containing a .bek file)
- A user's password (not to confuse with a user's logon password) / recovery key

These methods can be used either individually or as a combination thereof. If they are used as a combination, knowing the decryption information for only one method is enough to unlock the device.

R-Studio can unlock devices encrypted with **BitLocker** provided that all the necessary information is known.

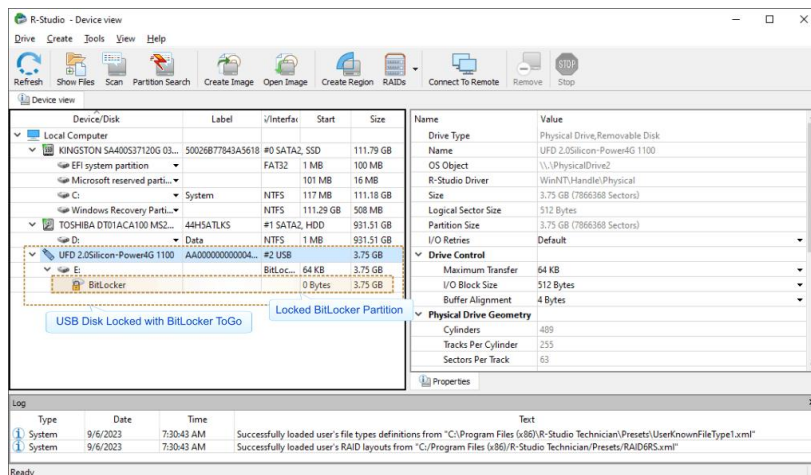

BitLocker ToGo

This is the method used to lock external removable devices. The password or a recovery key is necessary to know to unlock the device. A recovery key may be in the printed form or contained in a file. A name of such a file has the following pattern: BitLocker Recovery Key 600397A9-48AA-4DE4-B775-C71EB130EA1B.txt, where the last characters is the **BitLocker** volume identifier. That file contains the **BitLocker** volume identifier and a recovery key.

To unlock a BitLocker ToGo device,

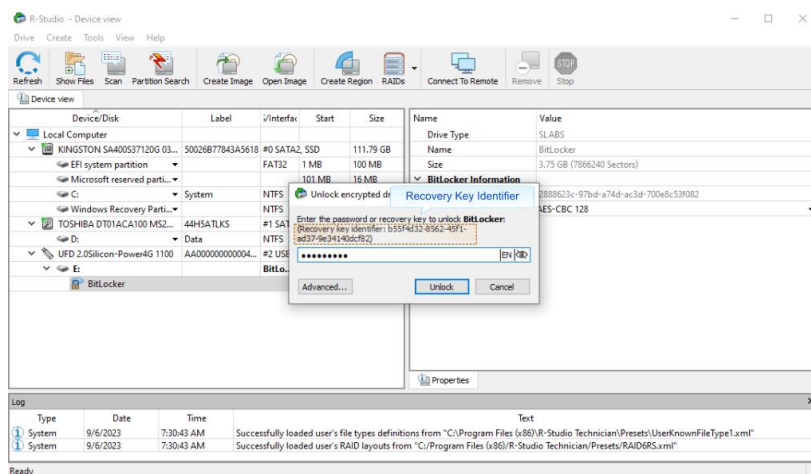

- 1 Locate the device and double-click the BitLocker partition.

BitLocker ToGo

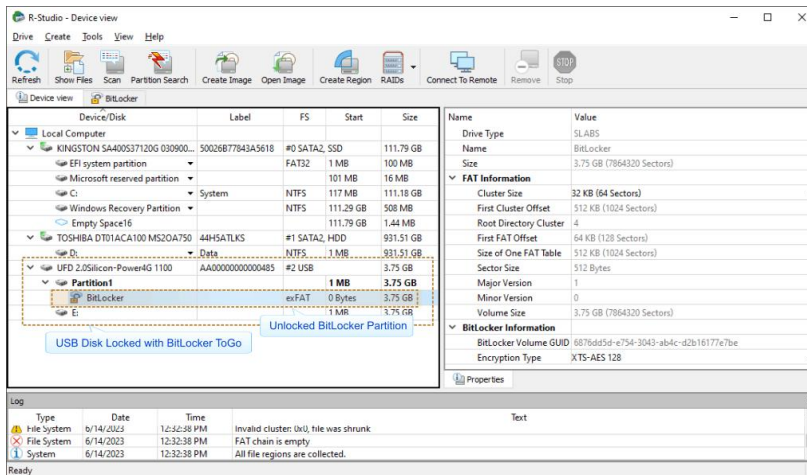

- 2 Enter the password or recovery key and click the Unlock button.

BitLocker ToGo

- > **R-Studio** will unlock the volume

BitLocker ToGo

BitLocker System Drive Encryption

This is the method used to lock internal system drives.

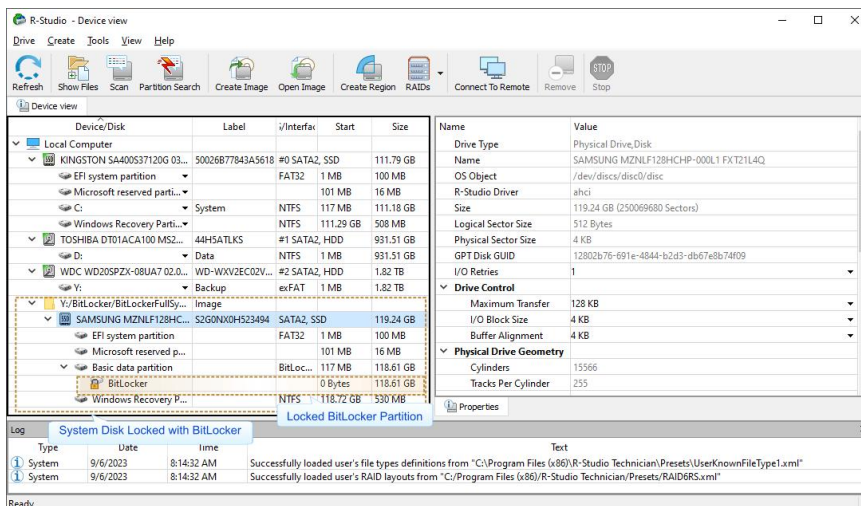

Depending on what methods are used, the following information is necessary to know to unlock the drive.

- A recovery key in the printed form or in a file. A name of such a file has the following pattern: BitLocker Recovery Key FDA7B96C-635E-45AA-BE63-00C3DB3771EE.txt , where the last characters is the **BitLocker** volume identifier. That file contains the **BitLocker** volume identifier and a recovery key.
- A password used to start the preboot process. It shouldn't be confused with the password for the user's login.
- An external USB flash drive containing its .bek file. Note that Windows sets System and Hidden attributes for such files and Windows doesn't show such files by default.

To unlock a system drive with a BitLocker partition,

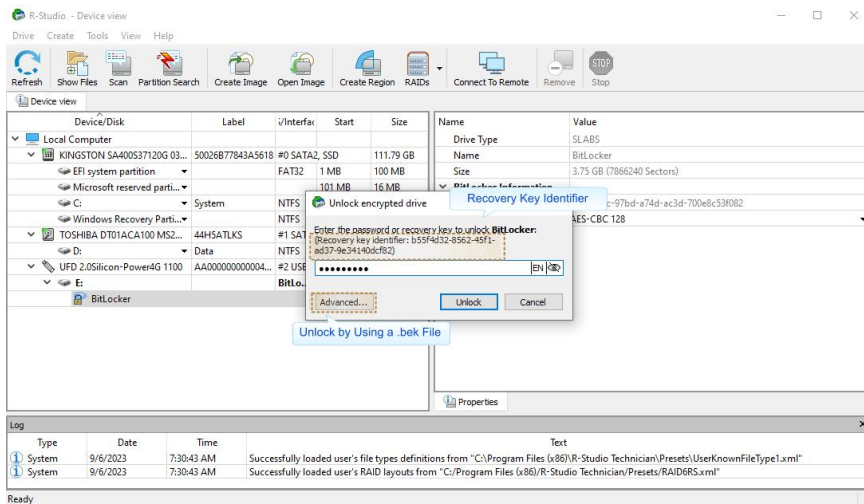

- 1 Locate the device and double-click the BitLocker partition.

BitLocker System Drive Encryption

- 2 Enter the password or recovery key and click the Unlock button.

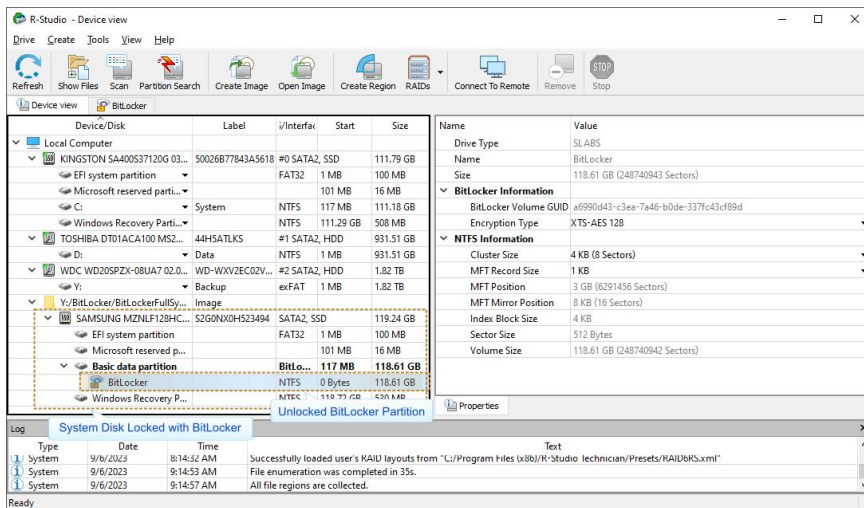

BitLocker System Drive Encryption

If you have the `.bec` file, click the **Unlock by key file** button and load the file.

> R-Studio will unlock the volume

BitLocker System Drive Encryption

TPM/TPM+PIN modes

Only in registered **R-Studio Technician/T80+** versions.

If only the TPM/TPM+PIN hardware was used to encrypt the partition, you must have either the FVEK (Full Volume Encryption Key) or VMK (Volume Master Key) data. Obtaining these keys is a very hard task, only quite advanced forensic professionals can do that using specialized hardware. Sometimes it may be possible to extract a FVEK from memory dumps and/or hibernation files, but this is still not a trivial process.

If you have FVEK or VMK data, click the **Advanced** button, select the key type of the data, enter the key or load a file with the key.

BitLocker TPM/TPM+PIN modes

R-Studio will unlock the volume.

You may also save and load encryption information from a BitLocker Encryption volume.

2.4.12.2 Windows Dynamic Disks

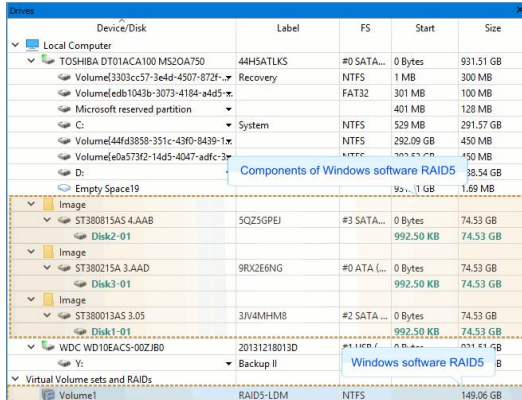

R-Studio supports [dynamic disks](#), including [Windows software RAID5](#), mirrors, and spanned volumes. When **R-Studio** detects components from such dynamic disks, it assembles them accordingly.

Windows dynamic disks (RAID5)

R-Studio detects components from dynamic disks and creates those dynamic disks automatically. At the same time, **R-Studio** gives access to the parents of the dynamic disks (drives and images).

Windows dynamic disks (RAID5) in R-Studio

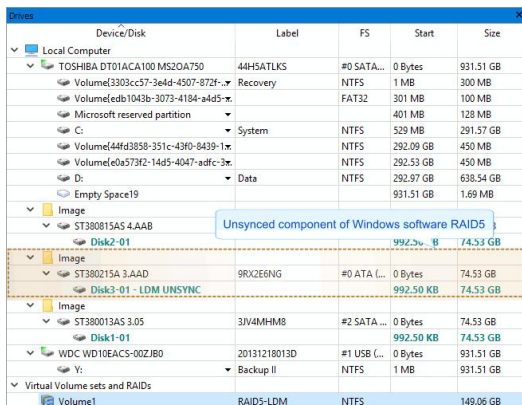

If recognized parents of a dynamic disk, including drive images, are added to **R-Studio** later, it automatically adds them to their respective dynamic disk.

When an automatically created dynamic disk is selected, **R-Studio** highlights its components.

Also, **R-Studio** automatically detects inconsistent components of dynamic disks and marks them accordingly.

Windows dynamic disks (RAID5) with unsynced parent

R-Studio shows the components of the selected dynamic disk on its LDM Components tab.

LDM Components tab

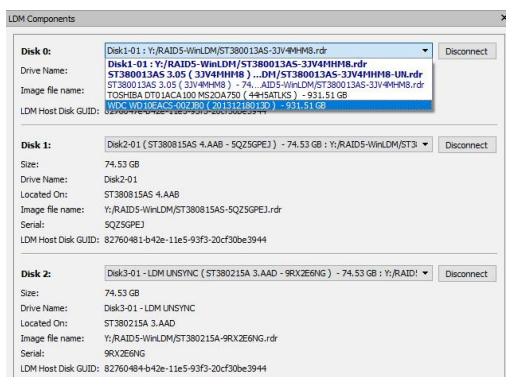

R-Studio shows broken dynamic disks in pink.

Broken dynamic disks in R-Studio

Device/Disk	Label	FS	Start	Size
Local Computer				
TOSHIBA DT01ACA100 MS20A750	44HSATLKS	#0 SATA...	0 Bytes	931.51 GB

Y:				
Virtual Volume sets and RAID5				
Volume1	RAID5-LDM	NTFS		149.06 GB

The LDM Components tab also allows you to manually disconnect or connect the components, for example, if they are such damaged that **R-Studio** cannot recognize them as parts of a broken dynamic disk. Select the object from the drop-down box and click the **Connect** button. **R-Studio** displays the objects it recognizes as the components of the dynamic disk in blue.

Adding a component manually

You may immediately switch to the dynamic disk configuration that **R-Studio** believes most probable by clicking the **Reassemble** button.

R-Studio shows dynamic disks with manually added components in blue:

2.4.12.3 Windows Storage Spaces

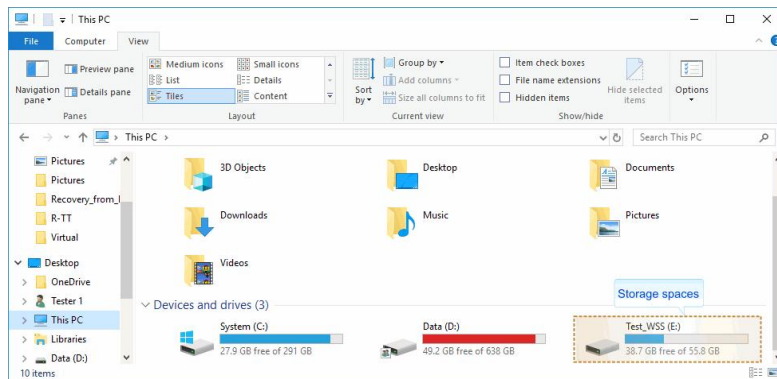

[Storage pools and spaces](#) is a new storage technology, first introduced in Windows 8 and Windows Server 2012, that allows the user to combine various (not always similar) drives into a kind of a RAID or compound

volume. First, the drives are combined into a storage pool, then several storage spaces with striping (similar to RAID0), mirroring (similar to RAID1), and parity (similar to RAID5) can be created in that storage pool. You may read more about storage pools and spaces in the Microsoft's [Storage Spaces: FAQ](#).

R-Studio supports Windows Storage Spaces created by Windows 8/8.1 and Windows 10/Threshold 2/ Anniversary/Fall Creators updates.

When drives from a storage pool are connected to a Windows computer, it automatically detects them and assembles storage spaces accordingly.

Storage spaces

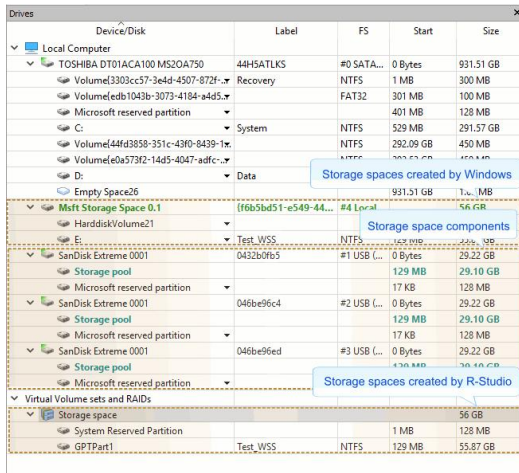

Storage pools and spaces can be managed using the **Storage Spaces** item in the **Control Panel**.

Storage spaces

R-Studio detects drives (or their images) from storage pools and creates storage pools and spaces automatically. At the same time, **R-Studio** gives access to the parents of the storage spaces (drives and images).

Storage spaces in R-Studio

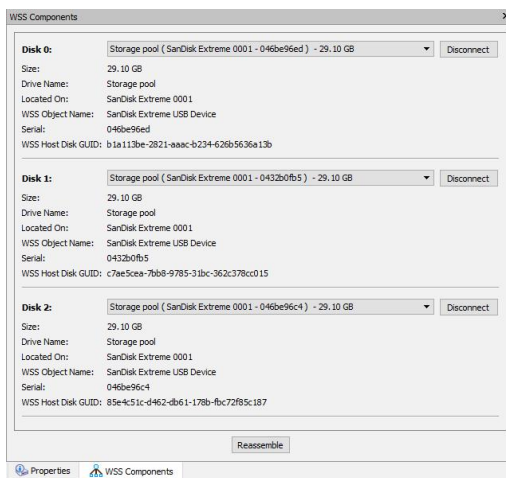

If recognized parents of a storage space, including drive images, are added to **R-Studio** later, it automatically adds them to their respective storage space.

When an automatically created storage space is selected, **R-Studio** highlights its components. It also highlights the storage space that Windows may itself create from the same components.

R-Studio shows the components of the selected storage space on its WSS Components tab.

WSS Components tab

R-Studio shows broken storage spaces in pink.

Broken storage spaces in R-Studio

If recognized components of an Apple RAID, including drive images, are added to **R-Studio** later, it automatically adds them to their respective Apple RAID.

When an automatically created Apple RAID is selected, **R-Studio** highlights its components.

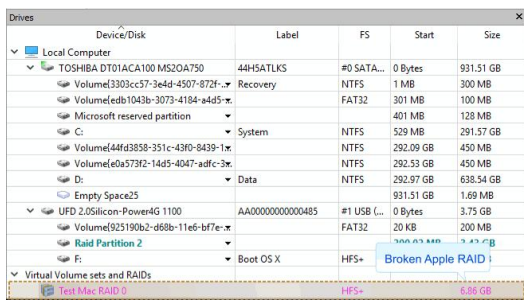

R-Studio shows the components of the Apple RAID on its MacOS Components tab.

MacOS Components tab

R-Studio shows broken Apple RAID's in pink.

Broken Apple RAID's in R-Studio

The MacOS Components tab also allows you to manually disconnect or connect the components, for example, if they are such damaged that **R-Studio** cannot recognize them as parts of a broken Apple RAID. Select the object from the drop-down box and click the **Connect** button. **R-Studio** displays the objects it recognizes as the components of the Apple RAID in blue.

Adding a component manually

You may immediately switch to the Apple RAID configuration that **R-Studio** believes most probable by clicking the **Reassemble** button.

R-Studio shows Apple RAID's with manually added components in blue:

Apple RAIDs with added components in R-Studio

2.4.12.5 Apple CoreStorage/FileVault/Fusion Drive Volumes

The macOS operating system has the following disk management systems:

[FileVault](#), is a disk encrypted utility;

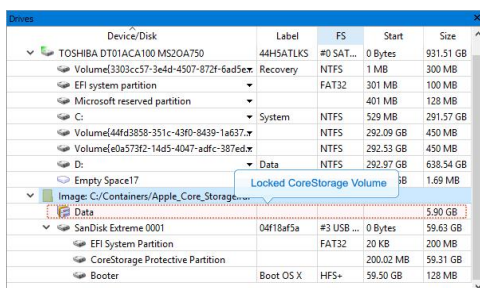

[Fusion Drive](#) is an Apple's hybrid drive technology;

[CoreStorage](#) is a logical volume management system.

R-Studio supports all these technologies and can unlock their encrypted volumes (drives and images) using either their passwords or recovery keys.

CoreStorage/FileVault

Locked CoreStorage Volume in R-Studio

To unlock the volume

1. Right-click the encrypted volume and select **Unlock encrypted drive** on the shortcut menu.
2. Enter the password/recovery key on the **Unlock encrypted drive** dialog box

> R-Studio will unlock the volume

Unlocked CoreStorage Volume in R-Studio

If the volume is partially encrypted, **R-Studio** can recognize which part is encrypted and which isn't. It will provide a correct access to the unencrypted and encrypted parts of the volume, provided that the correct password is entered.

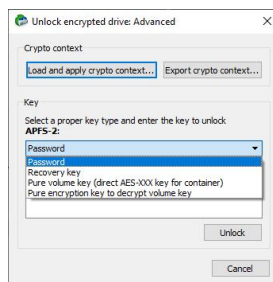

Partially encrypted volume

R-Studio Technician/T80+

In addition to the password, it's possible to enter other decryption data. Click the **Advanced...** button and enter available data.

Unlock encrypted drive: Advanced

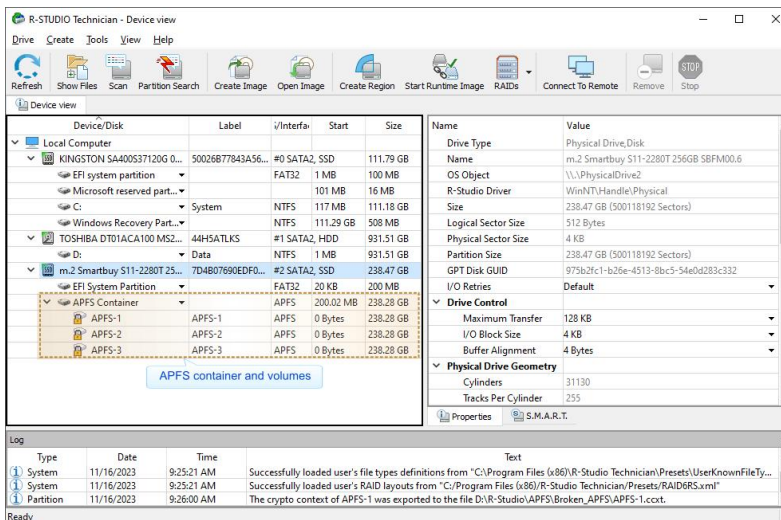

This data is usually very hard to obtain and only very advanced institutions can recover it from actual hardware.

Data recovery from deleted or damaged APFS volumes

When macos deletes an APFS volumes, it also wipes out all decryption information from its APFS container. In this case even knowing the password won't help. Still, there's a trick that may help to open a deleted or damaged encrypted volume.

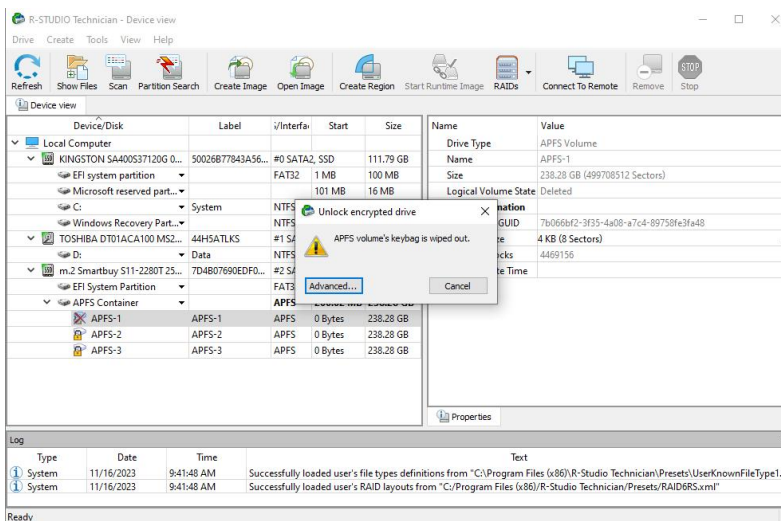

Let's us have a hard drive with an APFS container with 3 APFS volumes:

APFS container and its volumes

One of them has been deleted and **R-Studio** cannot unlock (decrypt) it:

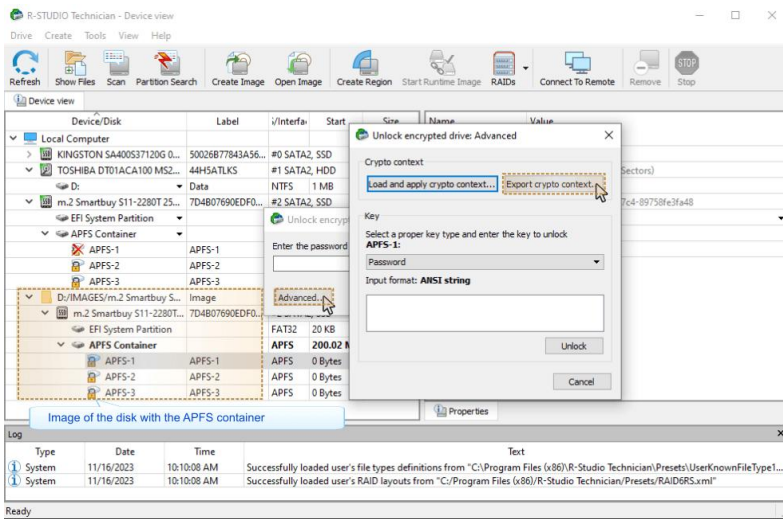

APFS container with a deleted APFS volume

But if we have an image of the disk's previous state, we can extract the necessary encryption information from that image.

Load the image and double-click the existing volume. Click the **Advanced...** button instead of entering its password.

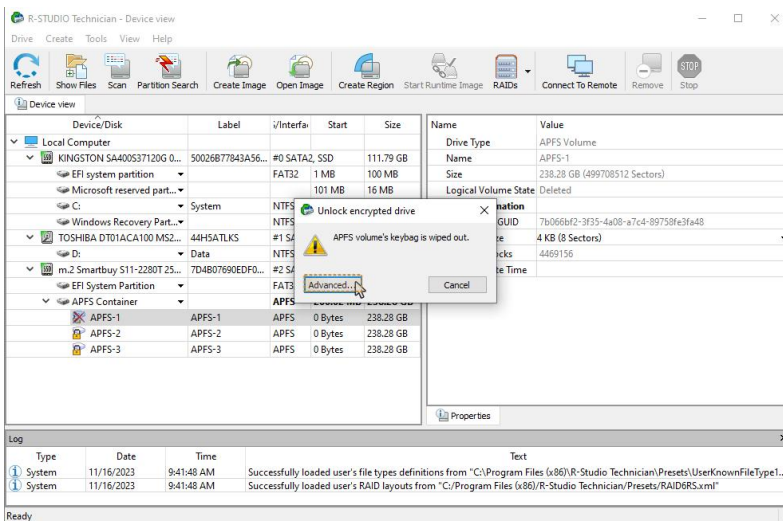

Export of encryption information

Click the **Export crypto context...** button and save a file with this information. Then click the **Close Image** button to unload the image.

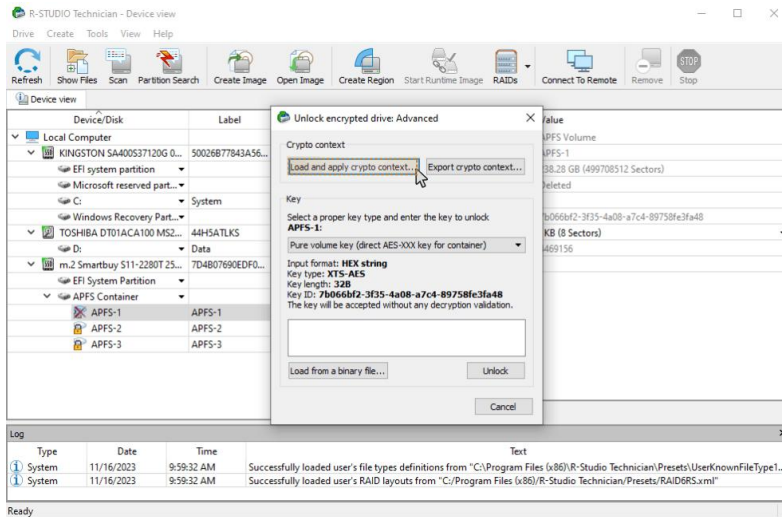

Then double-click the APFS-1 volume and click the **Advanced** button.

APFS container with a deleted APFS volume

Click the **Load and apply crypto context...** button

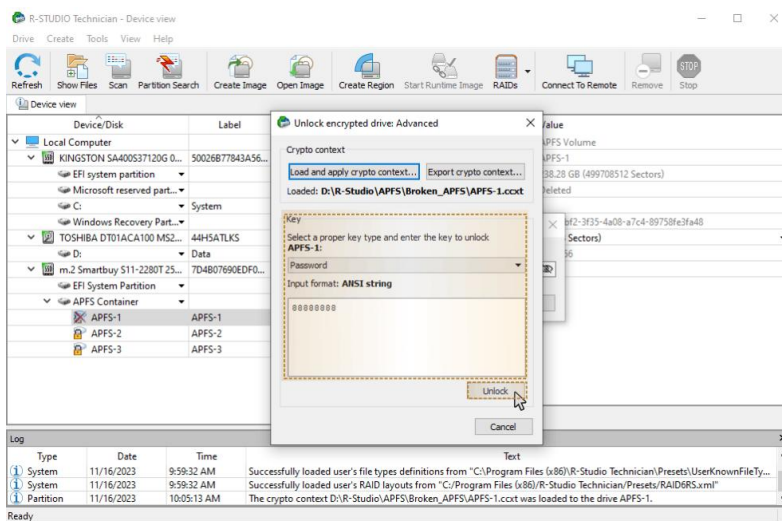

Loading the encryption information

and load the file generated from the image.

Select the required information type (a password for our case), enter the data, and click the **Unlock** button.

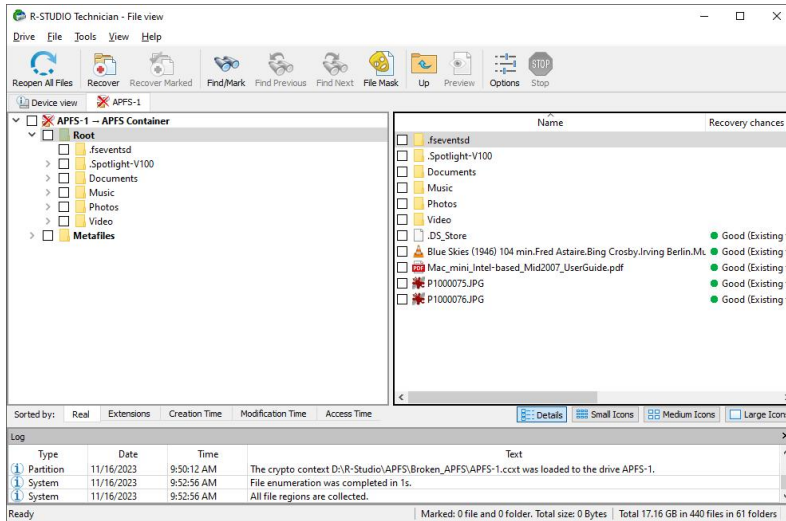

Unlocking the APFS volume

Note that the password will be explicitly shown.

R-Studio will open files on the volume.

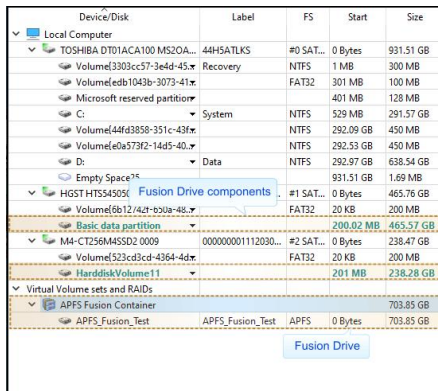

Files opened on the deleted APFS volume

Apple Fusion Drive

R-Studio detects components of Apple Fusion Drive and creates virtual Fusion Drives automatically. At the same time, **R-Studio** gives access to the individual components of the Fusion Drives (drives and images).

Fusion Drive in R-Studio

When an automatically created Fusion Drive is selected, **R-Studio** highlights its components.

R-Studio shows the components of the Fusion Drive on its APFS Fusion Components tab.

Fusion Drive Components tab

R-Studio shows broken Fusion Drive s in pink.

Broken Fusion Drive in R-Studio

2.4.12.7 Linux LVM/LVM2

Linux LVM is a logical volume manager for the Linux OS that manages drives and other data storage devices. Using it, It is possible to create single logical volumes on several physical drives, add and replace them in a running system, resize logical volumes, create various RAID configuration, and so on. You may read more about Linux LVM in our article: [What is Logical Volume Manager \(LVM\)](#).

LVM volume example

R-Studio detects drives from LVMs and creates their virtual volumes automatically. At the same time, **R-Studio** gives access to the components of the virtual LVM volumes (drives and images).

Disk 2	74.62 GB	Read Only	74.62 GB (Primary Partition)

And this virtual disk becomes accessible to the system and other programs.

To unmount a virtual drive

1 Right-click the virtual drive in the Drives panel and select Unmount on the shortcut menu

2.5 Data Recovery over Network

Available in the **Corporate and Technician/Y80+** versions. The **Standalone** version works with networks only in the Demo mode.

This chapter explains how to perform data recovery operations over network.

R-Studio has network capabilities that allow the system administrator, using its computer, to recover files on any computers accessible over network.

R-Studio supports the TCP/IP protocol and any protocol supported in Microsoft Network.

R-Studio Agent must be installed on computers where files are to be recovered. This program gives **R-Studio** access to local drives on remote computers over network.

If, due to file system crash, the network computer where you are going to recover your data cannot start, you may use [R-Studio Agent Emergency](#) to start the computer.

Files can be recovered without **R-Studio Agent** if the computer where the files are to be recovered runs Windows is accessible from a computer also running Windows. In this case, the administrator must have administrator privileges on the remote computer.

You should always disable a firewall and/or antivirus software on the both computers. As an alternative, advanced users may tune them to allow **R-Studio** and **R-Studio Agent** to communicate via network.

All data transmitted over network are encrypted with a strong algorithm for data security. Restoring data over network is very much the same as that on a local computer.

In addition, **R-Studio** can load/save any files like [drive images](#), [scan info](#) files, [RAID configuration](#) files, from/to the computers to which it has access using **R-Studio Agent**.

- [R-Studio Agent](#)
- [Data Recovery over Network](#)
- [Connecting over the Internet](#)

2.5.1 R-Studio Agent

R-Studio Agent is a program that provides **R-Studio** with an access to the drives of a network computer. It should be installed and properly registered on the computer which drives are to be accessed. **R-Studio Agent** has versions for the following PC operating systems:

- [Windows](#)
- [Mac OS](#)
- [Linux](#)

and there is [R-Studio Agent Emergency](#) that can be used to start a computer from which you are going to recover data that cannot start other way due to a file system crash, for example. Please, note that you need to use [R-Studio Emergency](#) as an emergency agent if you want to start a Mac computer.

R-Studio can work equally with all versions of **R-Studio Agent** and access computers run under Windows, Mac OS, and Linux.

You must have enough rights on the remote computer to install and run *R-Studio Agent*.

2.5.1.1 R-Studio Agent for Windows

R-Studio Agent should be installed under an administrator account.

When installed, *R-Studio Agent* starts automatically and runs as a service. To configure it, *R-Studio Agent* should be started again manually.

▣ **The following switches are available:**

-?	evokes a help screen;
-install	installs <i>R-Studio Agent</i> as a service
-remove	removes <i>R-Studio Agent</i> services
-console	starts <i>R-Studio Agent</i> as a console application

Started without a switch, *R-Studio Agent* runs as a GUI application and its icon appears on the taskbar tray. In this mode, it can be configured and its log may be viewed.

Simply connect to the remote computer providing a desired password for *R-Studio Agent* in the Connect to Remote Computer dialog box. **R-Studio** checks if there is *R-Studio Agent* running on this computer. If not, a Can't connect... message will appear.

Click the **Yes** button, and **R-Studio** will remotely install *R-Studio Agent*.

Attention Windows users: *R-Studio Agent* may be remotely installed over a network from a computer running Windows to another computer running Windows. To do so, you must have administrator accounts on both computers.

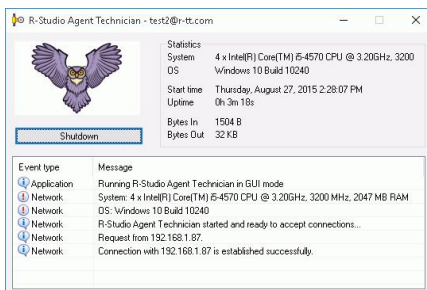

To access the *R-Studio Agent* main panel,

- 1 Click its tray icon

- > The main panel will appear. You may view its log

R-Studio Agent main panel

To configure *R-Studio Agent*,

- 1 Right-click its tray icon and select **Configure**

- Specify required parameters on the Please configure R-Studio Agent dialog box and click the OK button

Please configure R-Studio Agent dialog box

R-Studio Agent Options

Password:	Enter a password to obtain access to this computer from a network.
Re-Enter:	Re-enter the password.
Accepted Protocols	
Pipes	supported by Windows. To improve security, this option should be disabled.
TCP/IP	supported by any network OS.
Port	port for incoming connections
Accepted IP Addresses	
IP Address	specifies addresses from which this computer can be accessed.
Subnet Mask	specifies a subnet mask of the network from which this computer can be accessed.

- > *R-Studio Agent* will now run with the specified parameters

2.5.1.2 R-Studio Agent for Mac

You need to have an administrative account on the Mac computer to start **R-Studio Agent for Mac**.

To start the R-Studio Agent for Mac and access its main panel,

- Go to the Application folder, double-click R-Studio Agent for Mac, and enter the account password

- > The main panel will appear. You may view its log

R-Studio Agent for Mac main panel

To configure *R-Studio Agent for Mac*,

- Go to the R-Studio Agent for Mac menu and select Preferences

- 2 **Specify required parameters on the** Please configure R-Studio Agent **dialog box** and **click the OK button**

Please configure R-Studio Agent Mac **dialog box**

▣ R-Studio Agent for Mac Options

Password:	Enter a password to obtain access to this computer from a network.
Re-Enter:	Re-enter the password.
Incoming connection preferences	
Enable incoming connections	Select this checkbox if you want to allow incoming connections.
TCP/IP Port	A TCP/IP port for incoming connections
Accepted IP Addresses	
IP Address	specifies addresses from which this computer can be accessed.
Subnet Mask	specifies a subnet mask of the network from which this computer can be accessed.

- > *R-Studio Agent for Mac* will now run with the specified parameters

Connecting from R-Studio Agent for Mac to R-Studio.

To establish a connection from R-Studio Agent for Mac to R-Studio,

- 1 **Run the R-Studio Agent for Mac** and **select Connect** from the **Tools** menu
- 2 **Enter the necessary information on the** Connect to R-Studio **dialog box** and **click the Connect button.**

Connect to R-Studio **dialog box**

▣ Connect to R-Studio settings

Server	Specify the DNS name or IP address of the host where R-Studio is running.
Port	Specify the port set on the R-Studio Connect to Remote Computer dialog box.
Password	Specify the password set on the R-Studio Connect to Remote Computer dialog box.

- > **R-Studio Agent for Mac** will connect to the computer where **R-Studio** is running and it will show the drive and logical disk structure of the remote computer.

It can be processed the same way as that on a local computer.

2.5.1.3 R-Studio Agent for Linux

You need to have the root privileges to run **R-Studio Agent for Linux**.

Unlike [R-Studio Agent for Windows](#) and [R-Studio Agent for Mac](#), **R-Studio Agent for Linux** is a console application and should be run in the Terminal. You also need to mark it as an executable before start.

When it is started for the first time, **R-Studio Agent for Linux** asks for its configuration.

R-Studio Agent for Linux Configuration **dialog box**

```
File Edit View Terminal Help
root@BCK-Ubuntu:~# cd RSA
root@BCK-Ubuntu:~/RSA# ./rsagent
Configuring R-Studio Agent 6.0.1020
# Specify password for incoming connections >

It can be processed the same way as that on a local computer.

2.5.2 Data Recovery over Network

Generally, data restoring over network is very much the same as that on a local computer.

R-Studio Agent should be running on the network computer where data are to be recovered.

Read the [Connecting over the Internet](#) topic to learn how to establish connection between **R-Studio** and **R-Studio Agent** over the Internet.

To connect to a remote computer

- 1 Click the **Connect to Remote** button or select **Connect To Remote** on the **Drive** menu and select **Connect to the remote computer**

A list of nearby computers will appear in the [Computer List](#) on the **Connect to Remote Computer** dialog box.

Connect to Remote Computer dialog box

- 2 Select a computer from the list on the Connect to Remote Computer dialog box and enter the password

Otherwise, you need to specify in the Computer: field the name or IP address of the remote computer where data are to be recovered. The Port should coincide with the port specified for the [R-Studio Agent](#).

The Password: field is for the password of *R-Studio Agent* running on the remote computer. If you want to see the entered password, right-click the field and select **Show password** on the shortcut menu.

Note: If the remote computer is started with [R-Studio Agent Emergency](#), leave this field blank.

- > **R-Studio will connect to the remote computer and show its drive and logical disk structure of the remote computer below the device/@isk structure of your local computer**

Device/Disk	Label	FS	Start	Size

D:					

It can be processed the same way as that on a local computer.

Recover dialog box

When the Recover dialog box appears, you may select whether you want to save recovered files on the local or remote computer. Saving recovered files on a remote computer may be useful when the remote computer has a healthy drive because you do not have to transfer files over network. It may be an external USB drive, for example.

When **R-Studio** connects to the remote computer, it check if **R-Studio Agent** is present and its password. If there is no **R-Studio Agent** installed, **R-Studio** may try to remotely install it. See the [R-Studio Agent](#) topic for details.

2.5.3 Connecting over the Internet

Available in the Technician/T80+ only.

R-Studio and **R-Studio Agent** can be connected over the Internet. The connection can be made either using IP addresses or DNS names.

If hosts where **R-Studio** and **R-Studio Agent** are running have public IP addresses the connection can be made [the same way as for the local network](#), except that the IP address or DNS name should be explicitly specified in the Computer filed the Connect to Remote Computer dialog box

If either (or both) of the hosts are on private networks behind NATs and firewalls and do not have public IP addresses, the corresponding ports should be opened or forwarded. In addition, connection should be made either only from **R-Studio** or from **R-Studio Agent**.

Connection directions

* Both **R-Studio** and **R-Studio Agent** have public IP addresses (no [NAT/firewall](#)) or the ports on the [NAT/?](#) firewall are forwarded/[opened](#).

A connection can be made either from **R-Studio** or from **R-Studio Agent**.

* **R-Studio** is behind a NAT and **R-Studio Agent** has a public IP address or the ports on its NAT/firewall are forwarded/opened.

A connection should be made from **R-Studio**.

* **R-Studio** has a public IP address or the ports on its NAT/firewall are forwarded/opened and **R-Studio Agent** is behind a NAT.

A connection should be made from **R-Studio Agent**.

* Both **R-Studio** and **R-Studio Agent** are behind **NATs/firewalls**.

No connections are possible.

Connection from R-Studio Agent to R-Studio

R-Studio settings

If a connection is to be made from **R-Studio Agent** to **R-Studio**, **R-Studio** should be set to accept connection on the **Connect to Remote Computer** dialog box.

Connect to Remote Computer dialog box

Select **Wait connection from remote computer**, and specify options for incoming connections.

R-Studio Incoming Connection Options

Password:	Enter a password to obtain access to this computer from a network.
Allow connection from any address	Select this option if you want to allow connections to R-Studio from any IP address
Allow connection from the host	Select this option if you want to allow connections to R-Studio from a specific IP address or a network
IP Address	specifies addresses from which this computer can be accessed.
Subnet Mask	specifies subnet mask of the network from which this computer can be accessed.

Port port for incoming connections.

R-Studio will wait for an incoming connection.

Waiting for remote connection **dialog box**

Connecting from R-Studio Agent to R-Studio.

To establish a connection from R-Studio Agent to R-Studio,

(See the [R-Studio Agent for Mac](#) or [R-Studio Agent for Linux](#) help page to learn how to establish connections from those **R-Studio Agent** versions).

- 1 **Right-click the R-Studio Agent tray icon and select Connect**
- 2 **Enter the necessary information on the Connect to R-Studio dialog box and click the Connect button.**

Connect to R-Studio **dialog box**

☐ **Connect to R-Studio settings**

3.1 Portable version

R-Studio Technician may be installed on and run from, a removable device like a USB memory stick. This portable version has all functionality of an installable version and can be used on any Windows computer.

R-Studio Technician Portable creation

A device for the portable version should have approximately 500 MB of free space.

Select **Creation a portable version...** on the Installation mode panel during installation.

Installation mode

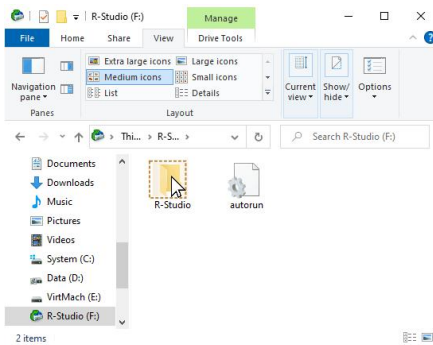

and continue installation process.

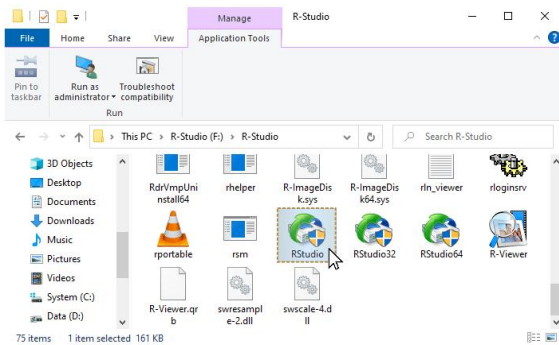

R-Studio Technician Portable start.

- * **Insert the removable device with R-Studio Technician Portable**
R-Studio Technician starts automatically if `AutoRun` and `AutoPlay` services are enabled. If they are disabled, go to the device and start the program manually.

R-Studio Technician Portable start

R-Studio Technician Portable start

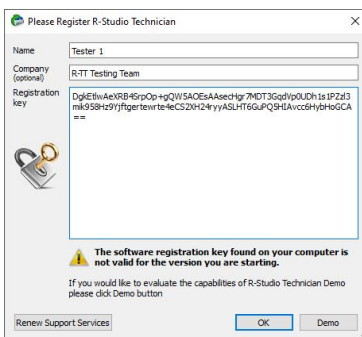

R-Studio Technician Portable activation

Sometimes **R-Studio Technician Portable** may need activation. You may do it the following way:

* If there's a working internet connection for the computer: enter the registration code for **R-Studio Technician Portable**.

R-Studio Technician Portable start

If there's no internet connections: You need to manually obtain an activation code to complete the registration. The Online Activation dialog window will appear.

R-Studio Technician Portable Online Activation dialog box

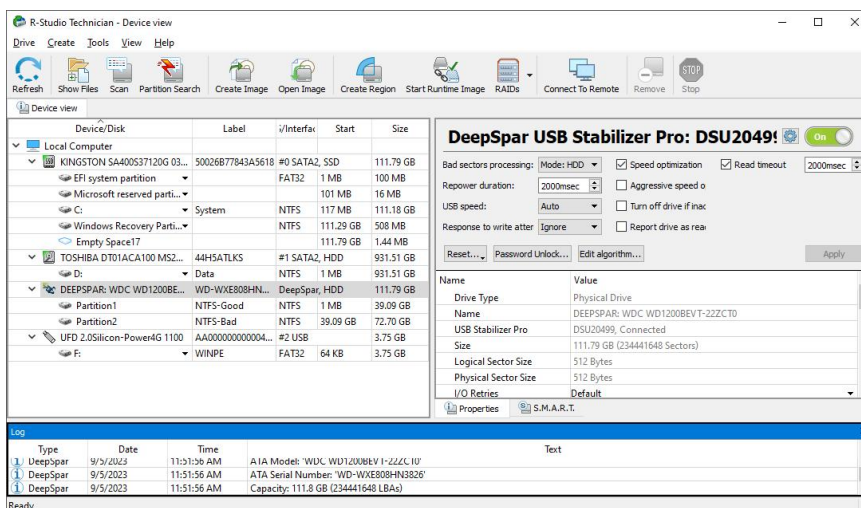

You may copy the url with the activation information and go to it on another computer connected to the Internet, obtain the activation code, and enter it into the respective field on the dialog box.

You may also use your smartphone to activate **R-Studio**. Scan the QR-code and go to the specified URL, obtain the activation code, and finish program activation.

R-Studio Technician Portable operation

You may work with the same way as with an installed **R-Studio Technician**, including its work with data recovery hardware.

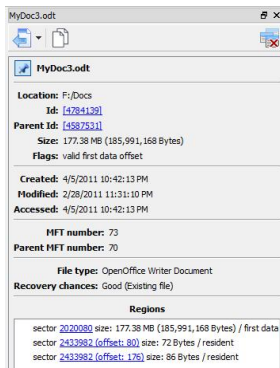

R-Studio Technician Portable with data recovery hardware

3.2 File Information

R-Studio Technician/T80+ shows much more information about files than **R-Studio** does.

Info about a file with good chances for recovery

Info for a file with below average recovery chances

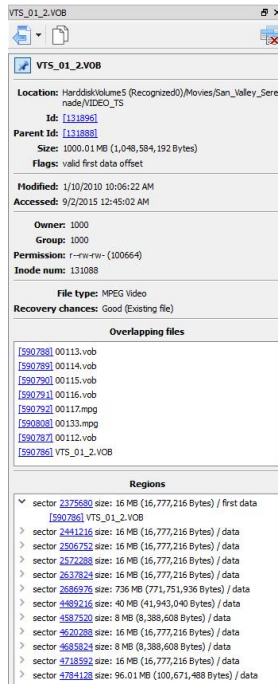

More information

	Click this button to pin the file information. This panel will show the information about the "pinned" file regardless of the current selected file.
	Click this button to copy all this information
 <div style="border: 1px solid gray; padding: 5px; width: 150px;"> <ul style="list-style-type: none"> [131530753] test4.arc [131596289] test5.arc [131727361] test7.arc [4784139] MyDoc3.odt [6252874458] MyDoc3.odt [6252874966] 002069.odt [6252872881] MyDoc1.odt <input checked="" type="checkbox"/> [6252874458] MyDoc3.odt </div>	Click this button to select the file you want to go to.
	Click this button to close all the information.
Overlapping files	Shows the list or files that may occupy the same drive sectors. You may click the file id to see information about this file.
Regions	Shows the list of sectors occupied by the file and corresponding overlapping files. You may click a sector number open the sector in the built-in Hexadecimal editor.

Examples of file information on other file systems

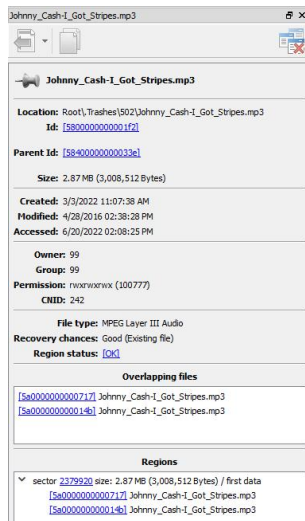

File info on an [ext4fs](#) file system

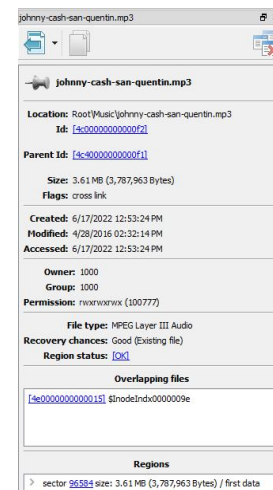

Info for a file on an HFS+ file system

File info on an APFS file system

Info for a file on an [XFS](#) file system

3.3 Custom Recovery Lists

The R-Studio Technician/T80+ versions can create more advanced [recovery lists](#).

Export Recovery List options

Export the entire folder/file tree Export marked file/folder names Export file/folder names	Specifies which file and folder names will be exported.
File format:	A file format for the recovery list. Only text format is available for the standalone and corporate versions.

	<p>R-Studio Technician/T80+ can create custom recovery lists in other formats with more advanced options</p> <p>The following formats are available for R-Studio Technician/T80+ version:</p> <ul style="list-style-type: none"> Plain Text HTML XML JSON CSV
File name:	Specifies a file name of the recovery list.

Editing the file recovery list

All files without any marks in the recovery list will be marked when the list is loaded into **R-Studio**. So, if you have some files in the recovery list that don't need to be recovered, just delete them from the list. In addition, you may use the following marks to specify some options

- :+ Mark the file, or the folder, all its files, and subfolders within the folder.
- * Mark the file, or the folder and its files, don't mark subfolders in the folder.
- Unmark the file, or the folder, its files, and subfolders in the folder.
- = Unmark the file or the folder and its files, dont unmark subfolders in the folder.
- ! Provide the information on the file. (**R-Studio Technician/T80+** only)

R-Studio processes records in the list consequently. That is, if there are the following lines in the file,

```
:+Files_to_Recover\  
:-Files_to_Delete\File_2.jpg
```

the file `File_2.jpg` won't be marked for recovery, while for the lines

```
:-Files_to_Recover\File_2.jpg  
:+Files_to_Recover\  
file File_2.jpg will be.
```

A simple recovery list for reference

If such recovery list is created from an entire logical disk/partition, it will contain several virtual folders. For example, they'll have the following structure for an NTFS partition.

```
///m/$Extend/
///m/$Extend/$Deleted/
///m/$Extend/$RmMetadata/
///m/$Extend/$RmMetadata/$Txf/
///m/$Extend/$RmMetadata/$TxfLog/
///m/$Extend/$RmMetadata/$TxfLog/$Tops
///m/$Extend/$RmMetadata/$TxfLog/$TxfLog.blf
```

▣ *A manually edited plain text recovery list*

The edited simple recovery list

The final simple recovery list will be the following:

```

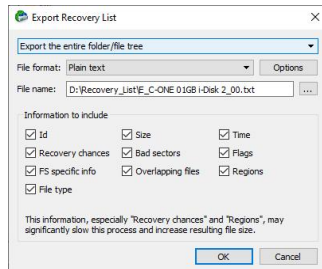

:# Version = 1
:# Sort = by real
:# PathDelim = /
:# CaseSensitive
:# Drive = type:"Volume"; size:"1048576000"; mountpoint:"e:\"; label:"ntfs test";
fs:"NTFS";
:# Parent = type:"Drive"; size:"1048576000"; serial:"2cca54405a8d3a89";
firmware:"2.00"; product:"01gb i-disk"; vendor:"c-one";
:= Diving/
:+ Diving/Aquarium/
:+ Diving/MyPhoto1.jpg
:+ Diving/MyPhoto3.jpg
:+ SF/
:- SF/Sea-Lions/
MyPhoto6.JPG
MyPhoto7.JPG
MyPhoto8.JPG
MyPhoto9.JPG

```

Plain text format

Custom recovery lists in the text format contains more information about files than simple recovery lists.

Export Recovery List dialog box for the plain text format

You may compare two versions of the same plain text recovery list:

▣ *An advanced text recovery list*

This is an advanced version of the recovery list described on the [Recovery List](#) page.

```

:# Version = 1
:# Sort = by real
:# PathDelim = /
:# CaseSensitive
:# Drive = type:"Volume"; size:"1048576000"; mountpoint:"e:\"; label:"ntfs
test"; fs:"NTFS";
:# Parent = type:"Drive"; size:"1048576000"; serial:"2cca54405a8d3a89";
firmware:"2.00"; product:"01gb i-disk"; vendor:"c-one";

Other recovery list formats

You may export recovery lists in the following formats:

XML format

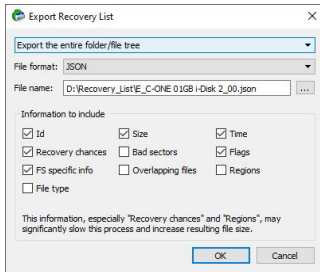

Export Recovery List dialog box for the XML format

JSON format

Custom recovery lists in the text format contains more information about files than simple recovery lists.

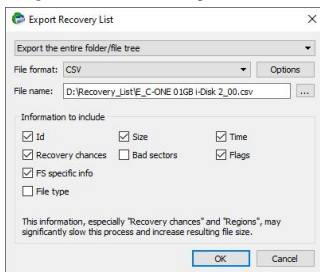

Export Recovery List dialog box for the JSON format

CSV format

Custom recovery lists in the text format contains more information about files than simple recovery lists.

Export Recovery List dialog box for the CSV format

CSV Options dialog box

3.4 Drive Copy Wizard

You may copy any object in the Drives panel to any other object, if there is enough space on the target one. Before **Copy object to...** becomes enabled on the **Create** menu, you need to enable writing.

To enable writing,

1 In the **R-Studio** main panel, select the **Tools** menu, then **Settings**, and select **Enable Write** on the [Settings](#) dialog box.

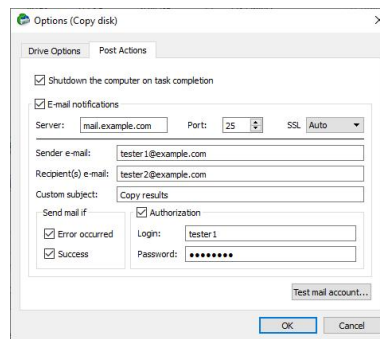

> The **Copy object to...** will be enabled on the **Create** menu.

Now objects can be copied.

While the objects are being copied, you may change some parameters and view the [I/O monitor](#) on the Object Copy Progress dialog box.

You may change some options during the copy process

Depending on the objects to copy and your tasks, you may do:

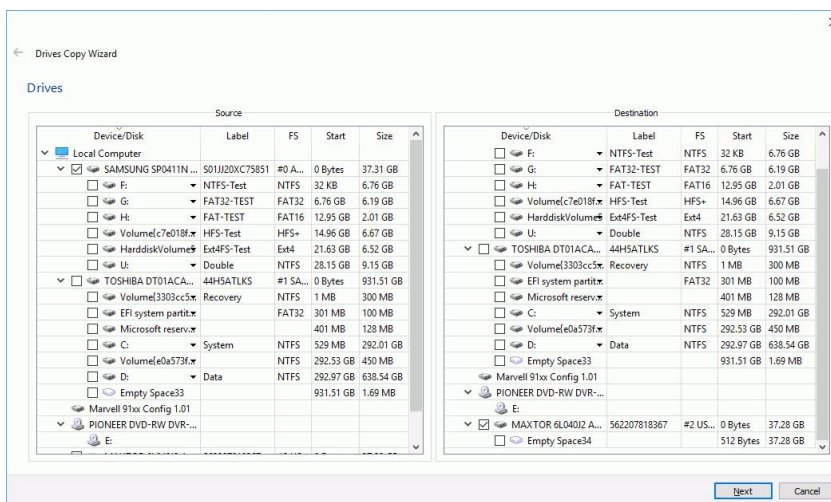

Binary (byte to byte copy)

An exact copy of the source object (or a part thereof) to the destination device (from its beginning or a specified offset). Any object may be copied to any object this way.

To perform a binary copy of an object,

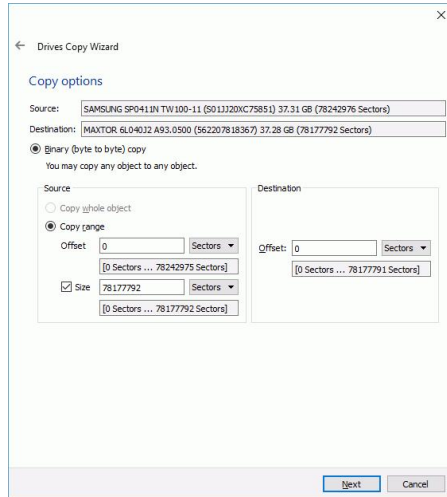

- 1 Select Copy object to... on the Create menu**
- 2 Select a source and destination objects in the Drives Copy Wizard panel and click the Next button**

Drives Copy Wizard

3 Select Binary (byte to byte) copy on the Copy Options dialog box, specify copy options, and click the Next button

Copy options dialog box

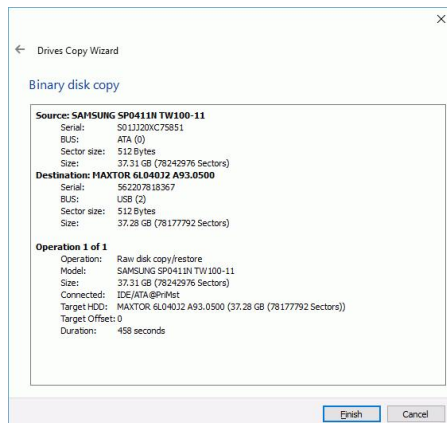

Copy options

Source	
Copy whole object	Select this option if you want to copy the entire source object to the destination one
Copy range	Select this option if you want to copy a part of the source object
Offset	Specify the offset from which the source object data will be copied to the destination object
Size	Specify the size of the source object data which will be copied to the destination object
Destination	
Offset	Specify the offset on the destination object to which the source object data will be copied

3 View the copy task settings on the Drives Copy Wizard and click the Finish button

Drives Copy Wizard

or click the <- Drive Copy Wizard button to edit the copy parameters

> **R-Studio will start copying data from the source object to the destination one.**

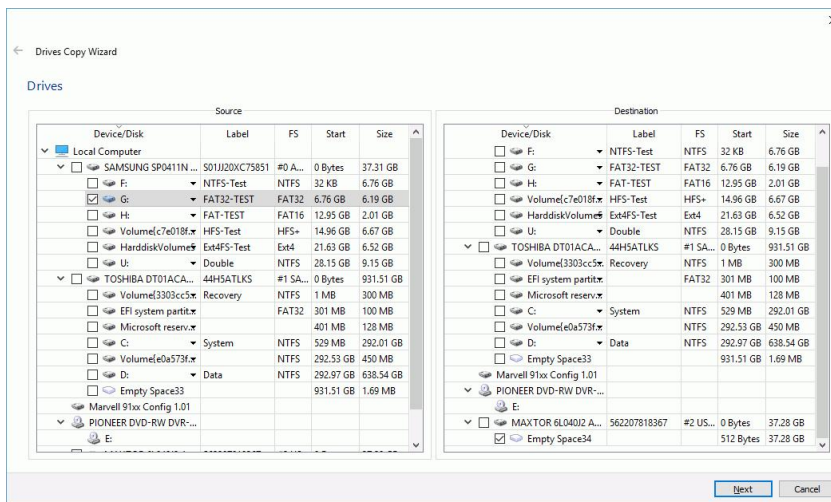

Smart partition copy

Only [partitions](#) can be copied with this option to other partitions or empty spaces. You may change some parameters of the the copied partition(s) on the destination drive.

To perform a smart partition copy of a partition,

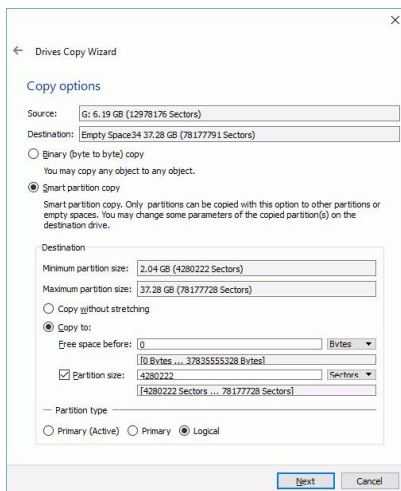

- 1 **Select Copy object to... on the Create menu**
- 2 **Select source and destination partitions in the Drives Copy Wizard panel and click the Next button**

Drives Copy Wizard

- 3 **Select Smart partition copy in the Copy Options panel, specify copy options, and click the Next button**

Copy options dialog box

Copy options

Destination

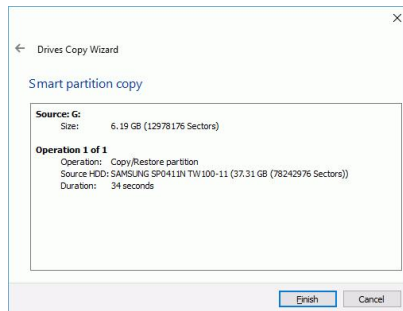

Copy without stretching

Select this option if you want to copy the partition exactly to the destination place

Copy to:	Select this option if you want to change some parameters of the copied partition on the destination place
Free space before	Specify how much space will be left empty before the start of the copied partition
Partition size	Select this option and specify the new size of the copied partition
Partition type Primary (Active)/? Primary/Logical	Specify the type of the partition to be copied. Do not change this setting unless you have serious reasons to do so.

3 View the copy task settings on the Drives Copy Wizard and click the Finish button

Drives Copy Wizard

or click the **Drive Copy Wizard** button to edit the copy parameters

> R-Studio will start copying data from the source partition to the destination place.

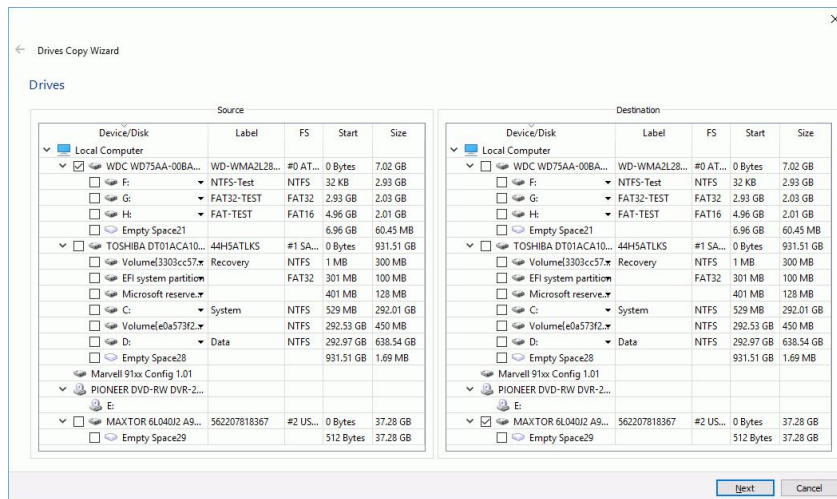

Smart drive copy

Only whole drives can be copied with this option to other drives. You may change some parameters of the copied drives.

To perform a smart drive copy of a drive,

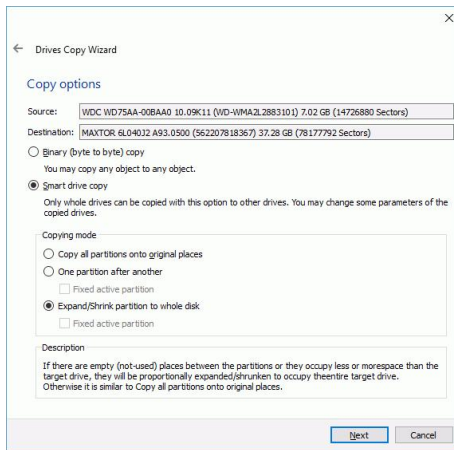

- 1 Select **Copy object to...** on the **Create** menu
- 2 Select a **source and destination drives** in the **Drives Copy Wizard** panel and click the **Next** button

Drives Copy Wizard

3 Select Smart drive copy in the Copy Options panel, specify copy options, and click the Next button

Copy options dialog box

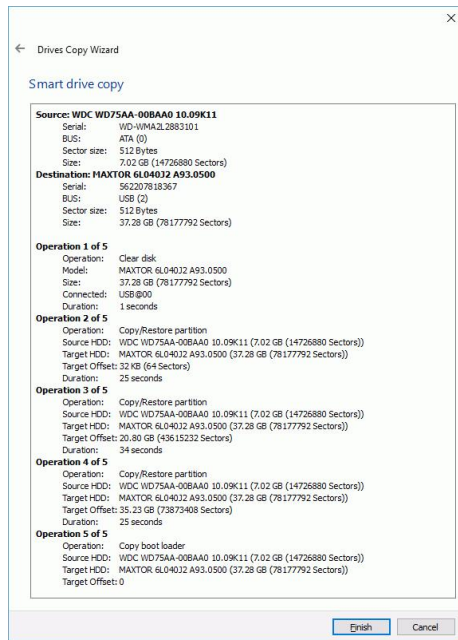

Copy options

Copying mode	
Copy all partitions onto original places	Select this option if you want to copy all partitions to their original places.
One partition after another	Select this option if you want to copy the partitions one after another preserving their space. If there is empty space between the partitions, it will be omitted. Otherwise it is similar to Copy all partitions onto original places. If Fixed active partition is selected, the original offset/size of the active partition will be preserved (in case the loader has links to it).
Expand/Shrink partition to whole drive	Specify this option if you want to proportionally expand/shrink the selected partitions to occupy the entire target drive. If Fixed active partition is selected, the original offset/size of the active partition will be preserved (in case the loader has links to it).

3 View the copy task settings on the Drives Copy Wizard and click the Finish button

Drives Copy Wizard

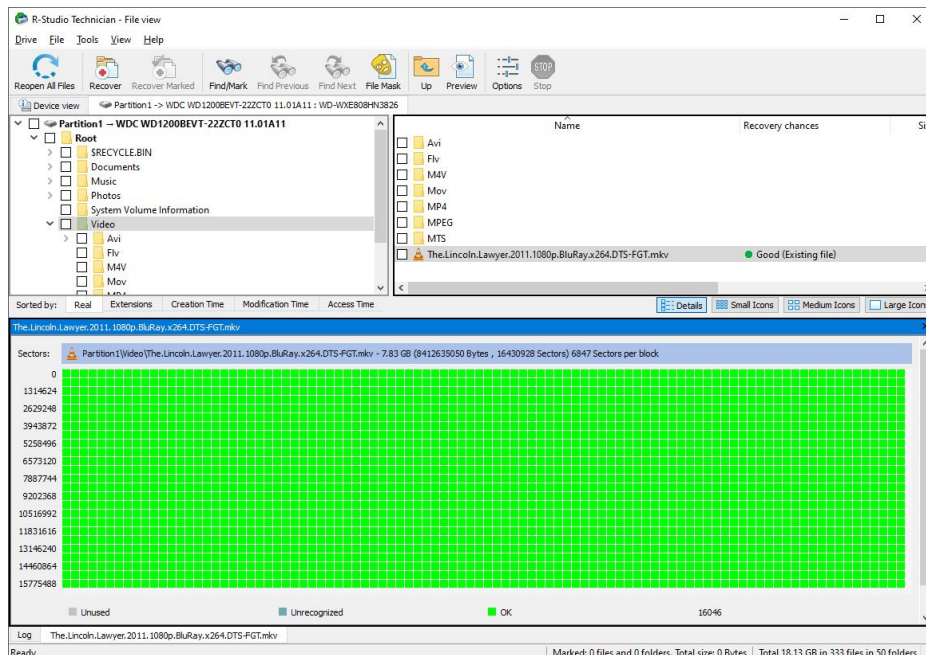

or click the **Cancel** button to cancel this process.

> **R-Studio will start copying data from the source drive to the destination one.**

3.5 File Maps

R-Studio can show file maps. Right-click the file and select **Map of file** in their shortcut menu.

File Map

3.6 I/O Monitor and Sector Map Files

These features greatly improves working with failing drives for **R-Studio**.

I/O Monitor

I/O Monitor allows you to inspect the process of drive input/output operations in real time. When **R-Studio** performs a disk operation the **I/O Monitor** button becomes active.

Click this button, and the **I/O Monitor** will appear.

I/O Monitor

You may also start **I/O Monitor** from the shortcut menu and progress dialog boxes during various drive operations.

Sector Map Files

[Sector map files](#) are files that contain information about conditions of drive sectors, which may be good, bad, slow, and unstable. **R-Studio** estimates chances for successful file recovery basing on these files and avoiding unnecessary attempts to read [bad sectors](#). Sector map files are crucial for [multi-pass imaging](#).

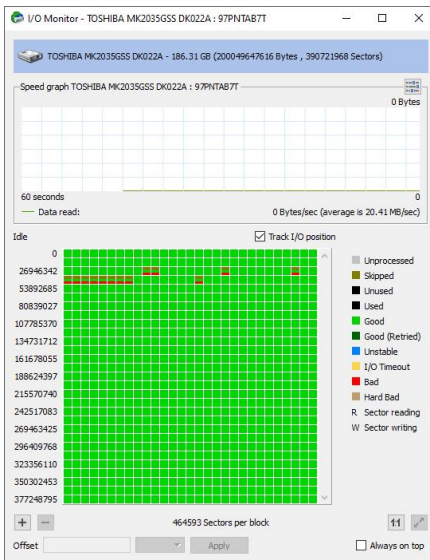

R-Studio creates its own sector map files or can import such files created from other disk imaging programs. Currently **R-Studio** supports sector map files from [HDDSuperClone](#) and [DDR Rescue](#).

To open, save or clean a sector map file for an object,

- * **Right-click the object and select Open Sector Map, Save Sector Map, or Clean Sector Map, respectively, on the shortcut menu.**

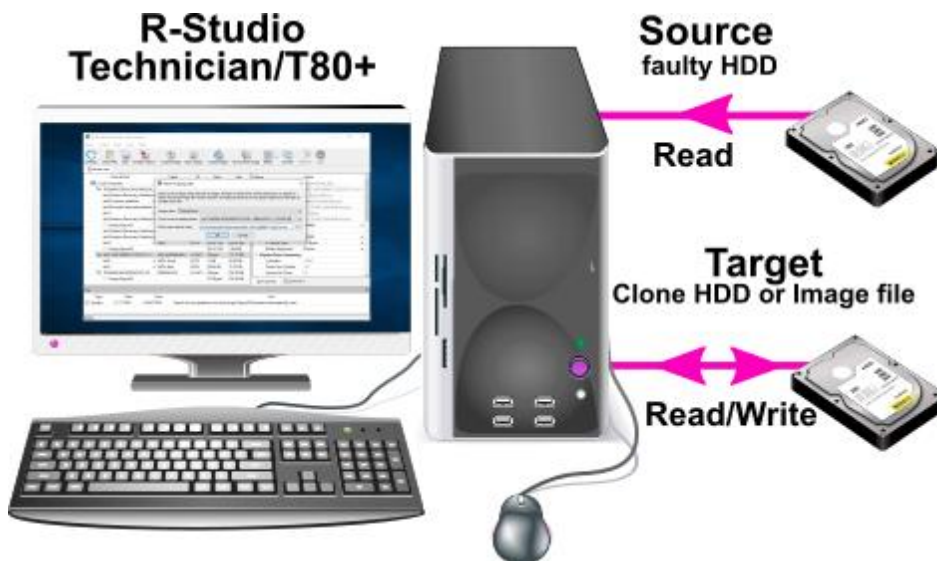

You may look at the graphical representation of the loaded sector map by starting **I/O Monitor**.

Sector Map

3.7 Runtime Imaging

Runtime imaging is [image](#) creation for a drive object performed simultaneously with other data read operations from this drive. When **R-Studio** reads data from a certain area of the source (a drive, [partition](#), or region), it writes the data to the target which can be either a dedicated drive or an image file. When the data from this area is needed again, **R-Studio** reads it from the target rather than the source thus reducing access to the source. This is very important for faulty or unstable drives which health may be constantly deteriorating during data recovery operations.

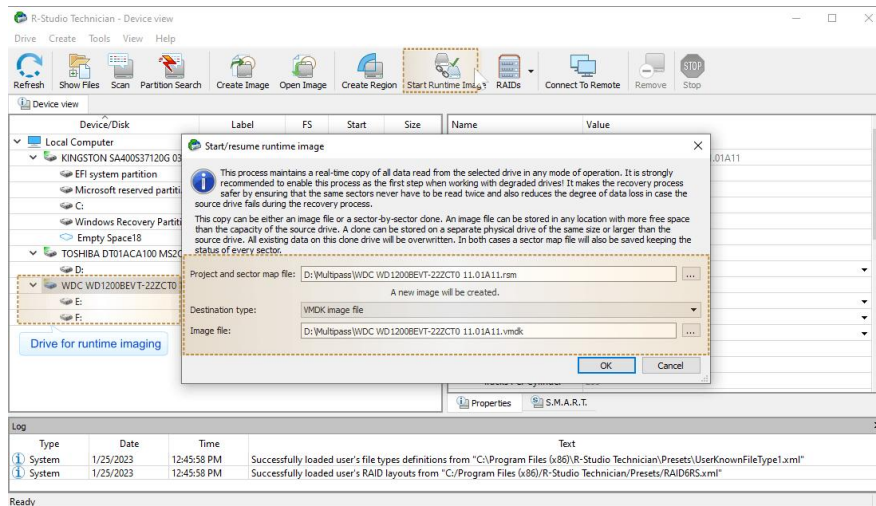

R-Studio also creates a [sector map file](#) during runtime imaging.

To start runtime imaging of an object,
using a plain image file

- 1 Select a drive object in the **R-Studio's** Drives panel and click the **Start Runtime Image** button, or right-click the object and select **Set Runtime Image** on the shortcut menu.

Runtime imaging

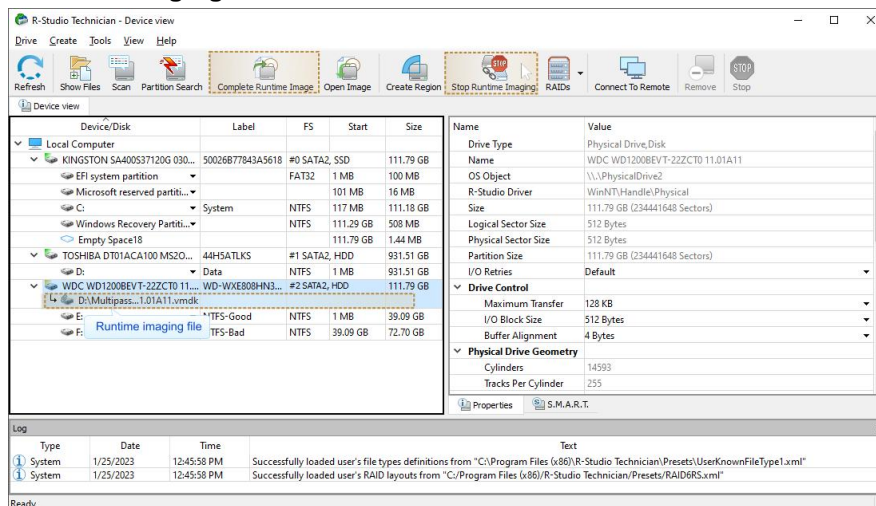

Select **Plain** or [another image type](#) in the **Image type** field, specify the file name and path for the image and sector map files, and click the **OK** button. Don't select the **VMDK image file** unless you can disable writing to the drive later. Cloning to a physical drive is not recommended because Windows can write some data to the drive corrupting the imaged data when the image has been completed and runtime imaging is over.

Plain image file requires immediate allocation of disk space equal to the object size, whereas **VMDK image file** is growing gradually upon imaging progress.

> R-Studio will turn on runtime imaging.

Runtime imaging

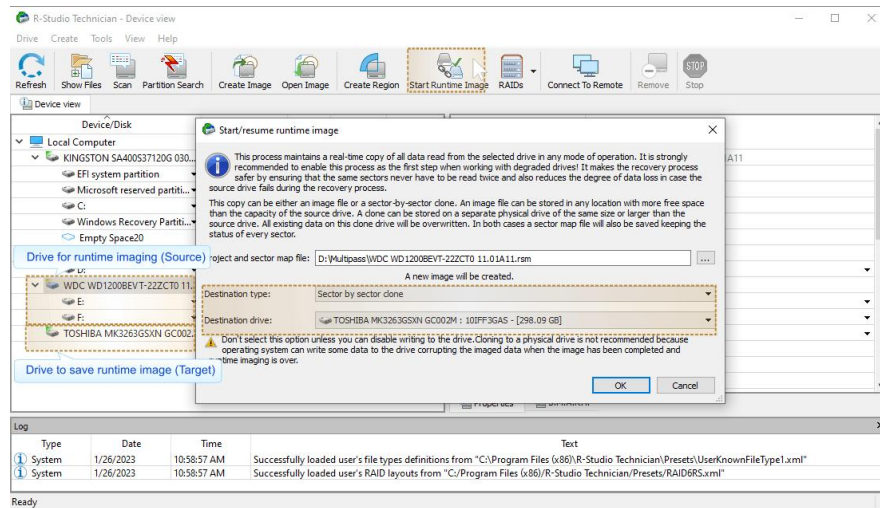

Select the object and click the **Stop Runtime Imaging** button or item in the shortcut o menu turn runtime imaging off.

using a physical drive

- 1 Select a drive object in the R-Studio's Drives panel and click the **Start Runtime Image** button, or right-click the object and select **Set Runtime Image** on the shortcut menu.1

Runtime imaging

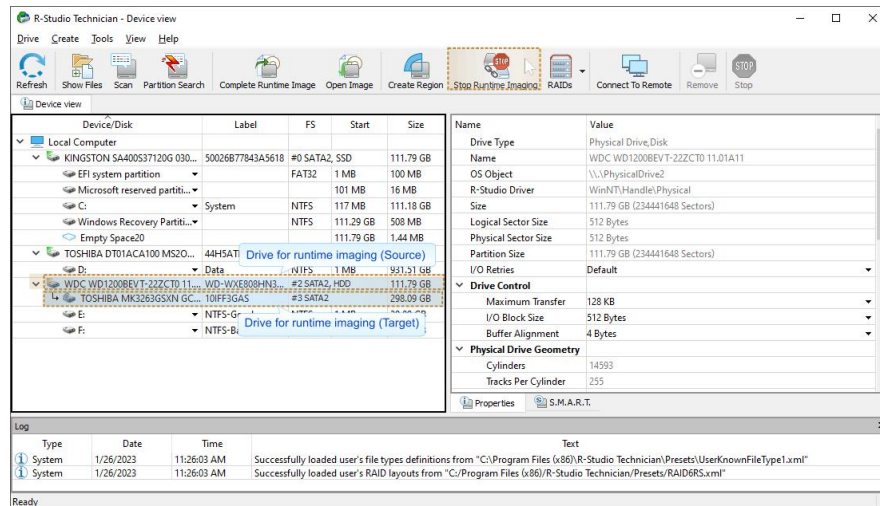

Select **Physical drive** in the **Image type** field, specify the name and path for the sector map file, and click the **OK** button.

Note: all data on the drive will be destroyed.

> R-Studio will turn on runtime imaging.

Runtime imaging

Select the object and click the **Stop Runtime Imaging** button or select this item in the shortcut menu to turn runtime imaging off.

R-Studio stores the information about runtime configurations and asks the users whether they want to keep runtime imaging or discard it during its startup.

Runtime imaging

This configuration will appear in **R-Studio**.

Runtime imaging

Device/Disk	Label	FS	Start	Size
Local Computer				
KINGSTON SA400S37120G 03090005	50026877843A5618	#0 SATA2, SSD		111.79 GB
EFI system partition		FAT32	1 MB	100 MB
Microsoft reserved partition			101 MB	16 MB
C:	System	NTFS	117 MB	111.18 GB
Windows Recovery Partition		NTFS	111.29 GB	508 MB
Empty Space19			111.79 GB	1.44 MB
TOSHIBA DT01ACA100 MS20A750	44H5ATLKS	#1 SATA2, HDD		931.51 GB
D:	Data	NTFS	1 MB	931.51 GB
WDC WD1200BEVT-22ZCT0 11.01A11	WD-WXE808HN3826	#2 SATA2, HDD		111.79 GB
D:\Multipass\WDC WD1200BEVT-22ZCT0 11.01A11.vmdk				
E:	NTFS-Good	NTFS	1 MB	39.09 GB
F:	NTFS-Bad	NTFS	39.09 GB	72.70 GB

Completing Runtime Image

You may complete the runtime image without browsing through the entire file system on the disk.

- 1 Select the object being imaged and click the **Complete Runtime Image** button, or right-click the object and select **Complete Runtime Image** on the shortcut menu.

Runtime imaging

The screenshot shows the R-Studio Technician interface. The toolbar at the top contains several icons, with 'Complete Runtime Image' highlighted. The main window is divided into a tree view on the left and a properties pane on the right. The tree view shows a list of disks, including a Kingston SSD and a Toshiba HDD. The properties pane shows details for the selected disk, such as Drive Type, Name, OS Object, and Physical Sector Size.

- > The Complete Runtime Imaging dialog box will appear.

Runtime imaging

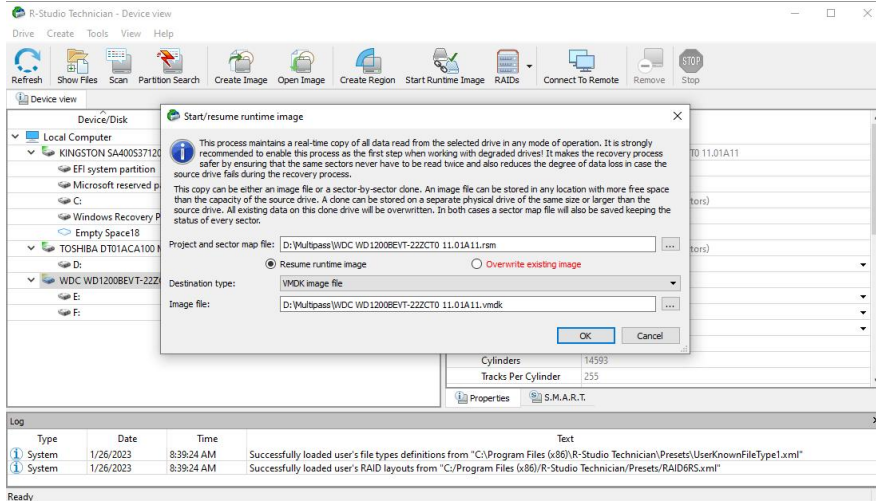

The screenshot shows the 'Complete Runtime Imaging' dialog box. The dialog box is titled 'Complete Runtime Imaging - WDC WD1200BEVT-22ZCT0 11.01A11'. It has a 'Runtime image file' field set to 'D:\Multipass\WDC WD1200BEVT-22ZCT0 11.01A11.vmdk'. The 'Data to process' dropdown is set to 'All data'. The 'Multi-pass image creation' section has several checkboxes: 'Perform reading in reverse order if possible' (unchecked), 'Minimum skip size' (1536 Sectors), 'Maximum skip size' (2344448 Sectors), 'Minimum I/O rate' (10 % of average speed), and 'Number of retries (Retrying phase)' (0). There are also checkboxes for 'Disable imaging phases' (Edges phase, Slow areas phase, Skipped blocks phase, Trimming phase, Scraping phase, Retrying phase).

Select the necessary [parameters of multi-pass](#) imaging and select the **OK** button.

> R-Studio will complete the creation of the runtime image.

If the runtime image has not been completed, you may resume it next time you start runtime imaging.

Runtime imaging

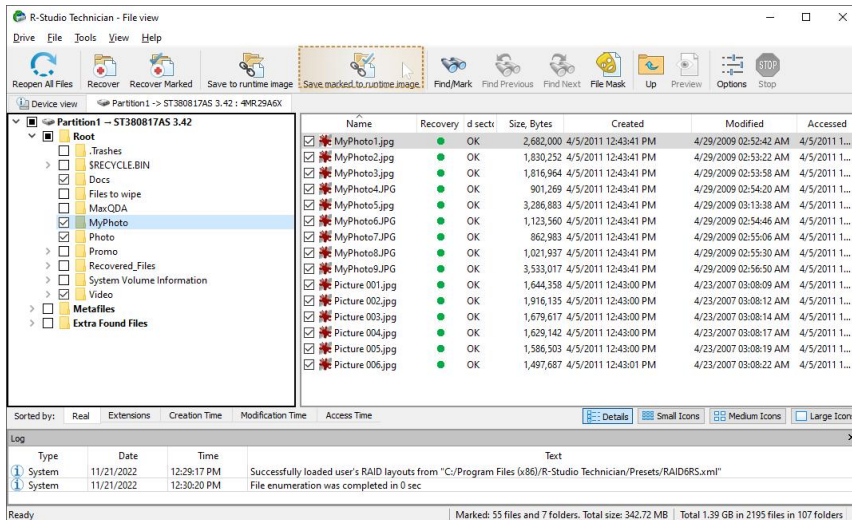

Creating runtime image for individual files

You may create a runtime image containing only individual files rather than all data on the disk.

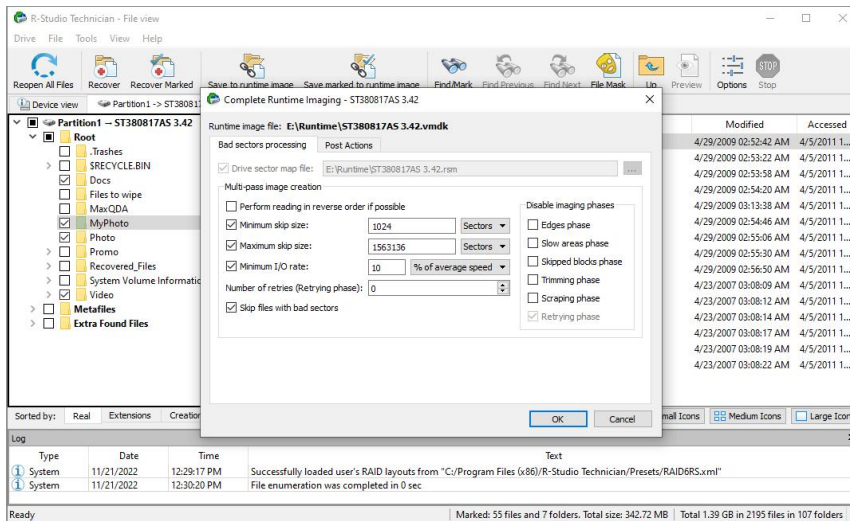

- 1 Open the disk with the files, mark the files, and click the **Save marked to runtime image** button. or right-click on the right pane, and select **Complete Runtime Image** on the shortcut menu.

Runtime imaging

- > The Complete Runtime Imaging dialog box will appear.

Runtime imaging

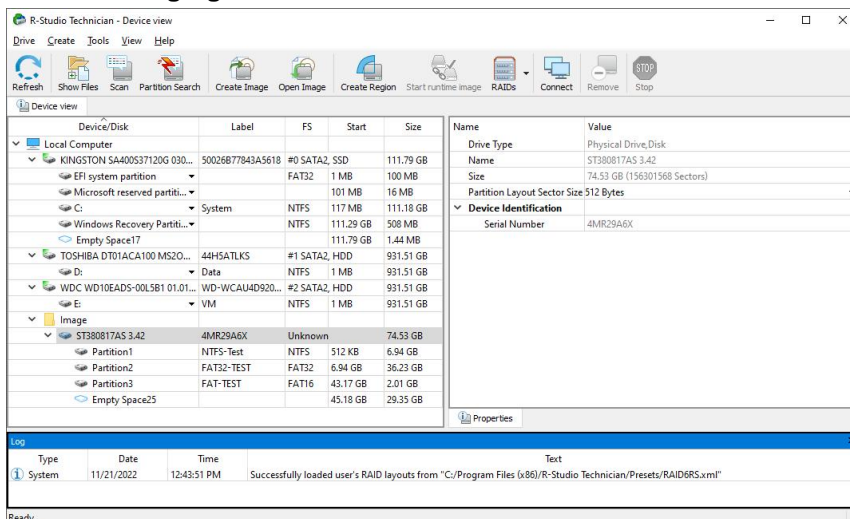

Select the necessary [parameters of multi-pass](#) imaging and select the **OK** button. You may Skip files with [bad sectors](#) if necessary.

- > R-Studio will complete the creation of the runtime image.

You may open such images as regular ones.

Runtime imaging

Such image contains information about the entire file system, but if a non-imaged file is opened, it'll contain only zeros.

3.8 Multi-pass Imaging

Multi-pass imaging is a process of [image](#) creation through several passes (phases). Each phase reads data from different areas of a hard drive, starting from areas with good sectors then going to slow sector areas and finishes with [bad sector](#) areas. This approach maximizes the amount of data that can be recovered from a failing drive and reduces its chances to fail during this process.

Phase 1. Copying most good data from the drive

In this phase, **R-Studio** reads data from drive by sector blocks, or groups of consecutive drive sectors read in one go. The phase is performed in several steps.

Step 1. R-Studio reads data from the drive until it runs into a block with bad or slow sector(s). Then it drops that block and jumps to another area until it finds a block with no bad or slow sectors. Then it continues reading data until it runs into another bad or slow block, and the process repeats. When this step is finished, most good data from the hard drive has been read, and **R-Studio** has detected the front blocks (edges) of bad and slow sector areas.

Step 2. R-Studio finds the rear edges of bad sector areas. It reads the skipped area from its rear end backwards until it runs into a block with a bad sector. Then **R-Studio** jumps to another bad sector area and the process is going on until all bad sector areas have been processed. When this step is finished, some good data from the hard drive has been read, and **R-Studio** has detected the rear edges of bad sector areas.

Step 3. R-Studio reads data from slow sector areas. It does that much the same way as for bad sector areas. When this step is finished, good data from slow sectors on the hard drive has been read, and **R-Studio** has detected the rear edges of slow sector areas.

Step 4. R-Studio finds the rear edges of bad sector areas in slow sector areas. When this step is finished, some new good data from slow sectors on the hard drive has been read, and **R-Studio** has detected the rear edges of all bad sectors within slow sector areas.

Step 5. R-Studio tries to read all skipped sector blocks. This is done without skipping bad sector blocks and checking read speed against minimum I/O rate.

When *Phase 1* is completed, **R-Studio** has read most of readable data and detected front and rear edges of all bad sector areas.

R-Studio tries to read the rest of data in the next phases, and does that sector by sector (rather than blocks).

Phase 2. Trimming

R-Studio detects the front and rear sectors of bad sector areas. When this step is finished, some new good data from bad sector areas has been read, and **R-Studio** has detected the front and rear sectors of all bad sector areas.

Phase 3. Scraping

R-Studio tries to read data from bad sector areas sector by sector.

Phase 4. Retrying (mostly optional)

R-Studio tries to read data from bad sectors through several attempts.

You may read more about this process in our article [Multi-pass imaging in R-Studio](#)

To create an image through multi-pass imaging,

1 **Select an object in the R-Studio's Drives panel and click the Create Image button**

Other ways to create the image

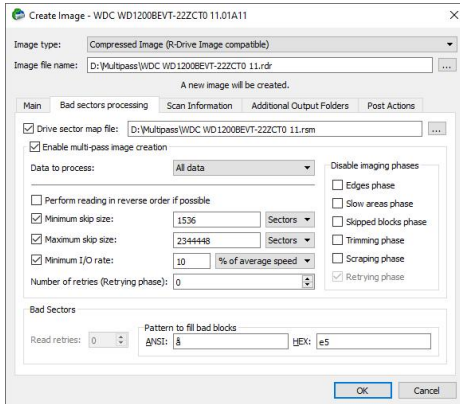

- Select the object and select **Create Image** on the **Drive** menu

OR

- Right-click the selected object and select **Create Image File** on the shortcut menu

2 Specify image options, a file name, and destination for the *image on the* Create Image dialog box and click the OK button

Create Image (Bad sector processing) dialog box

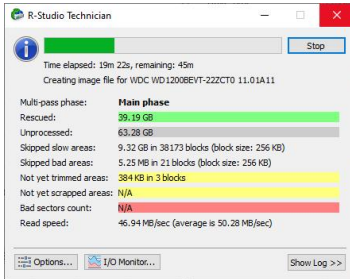

▣ Bad sectors processing options

These parameters can be changed even while the process of image creation.	
Image filename	Specifies the name and path for the image file
Image type:	Compressed image (R-Drive Image compatible): If this option is selected, R-Studio will create an image file which can be compressed, split into several parts, and password-protected. This image file is fully compatible with the images created by R-Drive Image , but incompatible with very old versions of R-Studio . Byte by byte image to a file: If this option is selected, R-Studio will create a simple exact copy of the object. Byte to byte image to a physical disk: R-Studio will create an exact copy of the disk on another hard drive. Data on the target drive will be overwritten. Available in the Corporate, Technician, and T80+ licenses. Some other image formats are also available in the Technician, and T80+ licenses. You may read more about these formats in the Supported Virtual Disk and Disk Image Formats page.
Drive sector map file	A file with the sector map of the object to image. Optional for the RDI image type, mandatory for the byte-by-byte and VMDK image types.
Enable multi-pass image creation	Turns multi-pass imaging on and off.
Data to process	All data: All data on the disk will be imaged. Existing files only (FS bitmap): Only the disk's area where existing files reside will be imaged. Unused clusters only: Only the disk's free space will be imaged. You may image the existing files first and then unused clusters.
Perform reading in reverse order if possible	Switches the direction of all phases/steps to reverse.
Minimum skip size	Minimum size of drive area to skip when a bad sector is encountered.

Maximum skip size	Maximum size of drive area to skip when a bad sector is encountered.
Number of retries (Retrying phase)	The number of read attempts in the Retrying phase.
Disable imaging phases	Multi-imaging phases that can be skipped. They can be skipped or added even during image creation

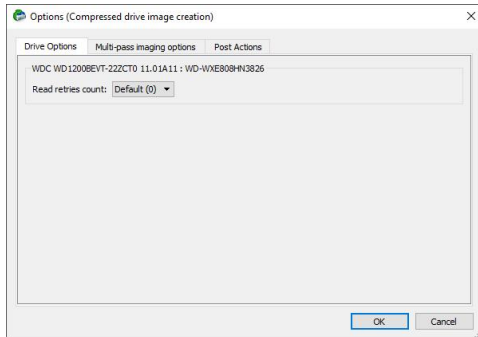

> **R-Studio will start creating the image, the Progress message showing the progress.**

Multi-pass imaging progress dialog box

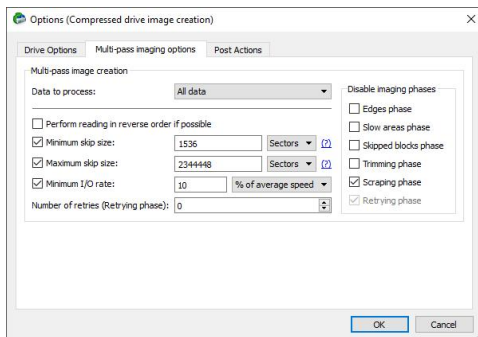

You may change operation parameters during image creation. Click the **Options** button and change them accordingly.

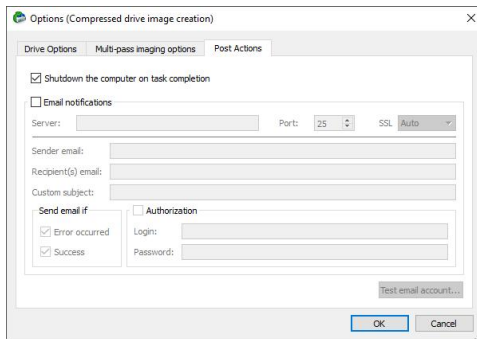

Drive Options tab

Multi-pass imaging options tab

Post Actions tab

3.9 Reverse RAIDs

Reverse RAIDs is a technique that is reverse to creating virtual RAIDs. When creating a reverse RAID, the data from a real object is decomposed into virtual parents. Then data on those virtual parents can be processed like on real objects. They can be viewed, edited, imaged, copied to physical drives, etc.

- **Reverse RAID of an Object**

This technique can be used to decompose data on a single volume into virtual parents. Then such virtual parents can be processed like on real objects. They can be viewed, edited, imaged, copied to physical drives, etc.

- **Reverse RAID of a RAID**

This technique can be used to re-construct data on individual RAID drives when data on physical drives is corrupted, but can be recovered using RAID redundancy. A missing drive is an example of this case. Or if there are [bad sectors](#) scattered over the physical drives but the overall RAID integrity remains. Then the data can be copied to physical drives to create a healthy RAID.

Note: Many controllers write their own metadata to drives to recognize that the drives belong to certain RAIDs. Without that metadata they won't see those RAIDs. You have to write that metadata manually.

3.9.1 Reverse RAID of an Object

This technique can be used to decompose data on a single object into virtual parents. Then such virtual parents can be processed like on real objects. They can be viewed, edited, imaged, copied to physical drives, etc.

Suppose you have an image of a former RAID 6 (Reed-Solomon) and you want to re-create data on individual drives from that RAID 6. You can do that by creating a reverse RAID of an [image](#).

Note: Many controllers write their own metadata to drives to recognize that the drives belong to certain RAIDs. Without that metadata they won't see those RAIDs. You have to write that metadata manually.

To create a reverse RAID of a drive image (or other drive object),

- 1 Right-click the drive object in the Drives panel and select Create Reverse RAID on the shortcut menu.

- Parity block
- Invalid block order
- Not ordered block
- Current sequence block
- Parity block of current sequence
- Member block of selected parity block

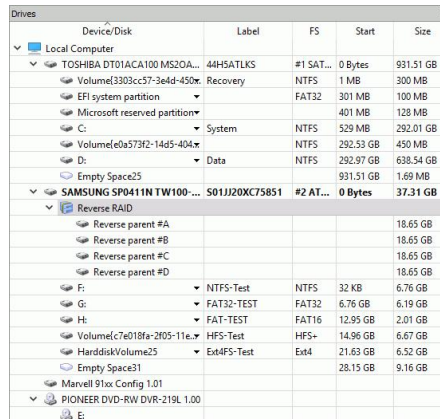

Apply changes immediately More... Apply

2 Adjust RAID parameters on the Parents tab, as necessary.

You need to add one reverse parent, change RAID type, and adjust RAID offset .

- > **Process the appeared reverse parents in the Drives panel as real objects.**
These parents can be imaged, viewed/edited, etc.

3.9.2 Reverse RAID of a RAID

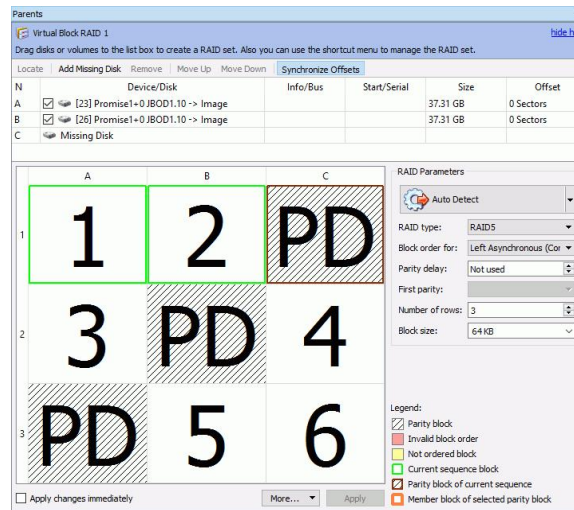

This technique can be used to re-construct data on individual RAID drives when data on physical drives is corrupted, but can be recovered using RAID redundancy.

Suppose you have a RAID 5 with one missing drive and you need to reconstruct data on that drive. You can do that by creating a reverse RAID for it and then copy data from that missing drive to a real one, or to an [image](#).

Note: Many controllers write their own metadata to drives to recognize that the drives belong to certain RAIDs. Without that metadata they won't see those RAIDs. You have to write that metadata manually.

To create a reverse RAID of a RAID with a missing drive,

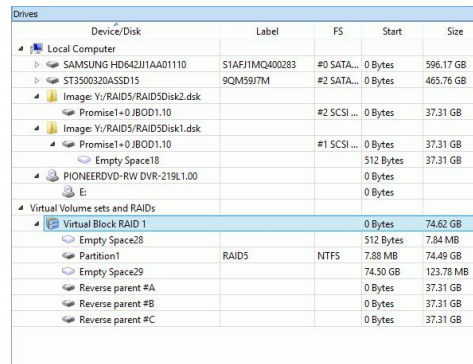

- 1 Create a virtual RAID 5 of the existing drives or their images**
Add a missing drive to the Parents tab.

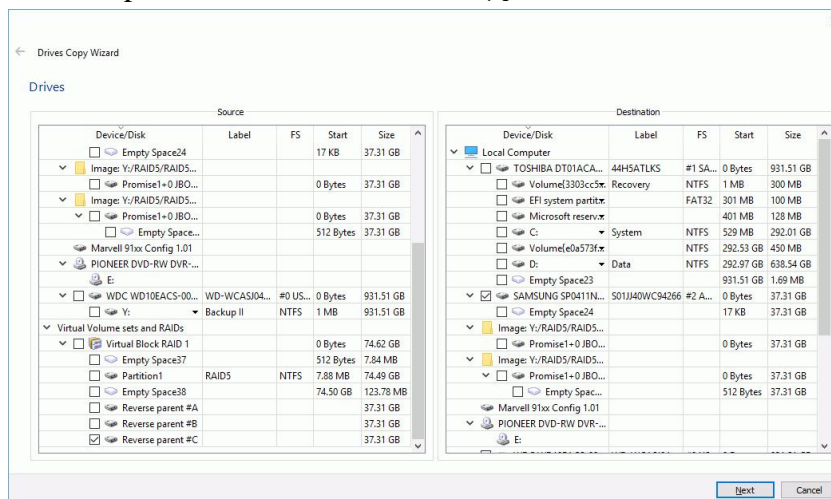

If necessary, read the [Basic RAID 4 and RAID 5 Operations](#) and [Volumes Sets and RAID5](#) help pages for details.

2 Right-click the Virtual Block Raid in the Drives panel and select Create Reverse RAID on the shortcut menu.

> The Reverse parents will appear in the Drives panel

These parents may be processed as real objects, they can be imaged, viewed/edited. For your case the missing drive can be copied to a drive in the Drive Copy Wizard.

Note: The reverse parents contain the data that should be on the RAID parents, according to its layout, while RAID parents contain actual data, that may be corrupted.

3.10 Working with the Third-Party Hardware

The Technician/T80+ version of **R-Studio** can work together with [third-party hardware](#) developed for in-depth data recovery. Currently, the following devices are supported:

- [DeepSpar Disk Imager™](#)
- [DeepSpar USB Stabilizer](#)
- [DeepSpar RapidSpar](#)
- [PC-3000 UDMA hardware](#)

3.10.1 DeepSpar Disk Imager™

DeepSpar Disk Imager™ (DDI) is an HDD imaging device specifically built for data recovery from drives with hardware issues. It greatly increases imaging speed, accuracy, and integrity of data retrieved from such drives.

The main features that **DDI** provides when working with drives are the following:

- Direct low-level access to a drive bypassing the computers BIOS.
- Disabling specific drive read/write heads.
- Disable SMART subsystem, Bad Sector Reallocation, and Read Look-Ahead
- Read sector timeout controlled by Software/Hardware/PHY drive reset commands
- Bit level analysis of corrupted data to filter out the read-write channel noise
- Fully customizable multi-pass imaging

And many more others an advanced drive imager must have. You may learn more about **DDI** on its vendor site: [DeepSpar Disk Imager™](#).

DeepSpar Disk Imager™ basics

The main idea of data recovery with **DDI** is to clone data from the source drive with a certain level of hardware malfunction to a clone drive and perform data recovery operations either from the clone drive or while data is being cloned. Such approach greatly reduces tear and wear of the source drive and reduces further deterioration of its state.

There are two modes in which **DDI** processes drives:

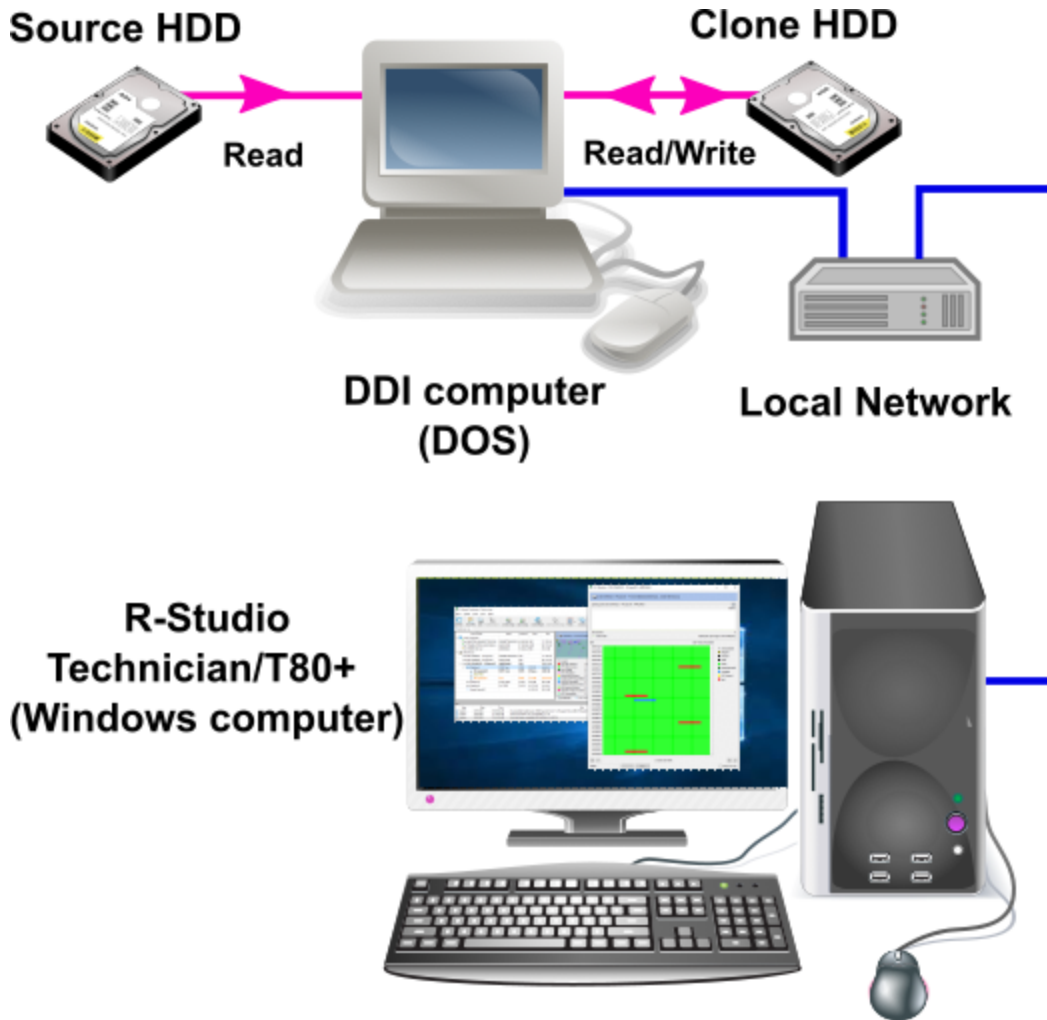

- **DDI** clones the entire source drive to the source one consequently, sector by sector. Any further data recovery will be made from the clone HDD.
- **DDI** clones those sectors of the source HDD which have been read during data recovery. Such readings are optimized to minimize the movement of the drive's head unit. All following reads from those sectors will be done from the clone drive. For example, if files are to be recovered from a [partition](#) on the drive, **DDI** will clone the boot record of the drive, the file table of the partition, and the sectors of the files. If the partition is scanned, the scanned sectors will be cloned, too. All consecutive operations, such as file preview, and so on, will be done from the clone drive. This greatly reduces the time necessary to perform the recovery operations and furthermore drive wear.

DeepSpar Disk Imager™ board

Read the **DDI** documentation on how to install **DDI** connect the drives to **DDI** and start working with it.

The **DDI** board should be installed into a separate network computer (the **DDI computer**), and the source and clone drives should be connected to it. The **DDI** computer should be started using the boot USB stick supplied with the board. **R-Studio** running on another computer (the **R-Studio computer**) accesses the drive via the network. All data recovery operations will be done through this setup:

There may be several **DDI computers** on the network, **R-Studio** will connect to all of them. Such configuration may be useful for RAID recovery when several drives on the RAID have hardware problems.

Working with DDI

To start working with **DDI**, its computer should be connected to **R-Studio**.

To connect R-Studio to the DDI computer,

- * **Select Connect to DDI on the Drive menu**
- > **The drives connected to DDI will appear in the Drive pane.**

Device/Disk	Label	nteface/F	Start	Size
Local Computer				
> KINGSTON SA400S37120G 03090005	50026B77843A5618	#0 SATA2, SSD		111.79 GB
> TOSHIBA DT01ACA100 MS20A750	44H5ATLKS	#1 SATA2, HDD		931.51 GB
> ST380817AS 3.42	4MR29A6X	#2 SATA, HDD		74.53 GB
DDI Devices				
DDI-DS400521 - VProject#1	50026B77843A5618	DDI		111.79 GB
DDI-DS400522 - VProject#2	44H5ATLKS	DDI		931.51 GB
DDI-DS400523 - VProject#3	4MR29A6X	DDI		74.53 GB
Partition1	NTFS-Test	NTFS	512 KB	6.94 GB
Partition2	FAT32-TEST	FAT32	6.94 GB	36.23 GB
Partition3	FAT-TEST	FAT16	43.17 GB	2.01 GB
Empty Space32			45.10 GB	29.35 GB

Now it is possible to work with drives connected to **DDI** like all other drive objects in the **Drive** panel. For example, such drives may be included into [virtual RAIDs](#) and other compound objects.

Viewing the drive map

A drive map shows the conditions for individual drive sectors. You may see which sectors are OK, bad, or unstable.

To view the drive map,

- * **Right-click the required drive/partition and select I/O Monitor on the shortcut menu,**
or
select the object and select **I/O Monitor** on the **Drive** menu
- > **The drive map will appear in the I/O Monitor window.**

DDI I/O Monitor window

You may also [image individual files](#) and view [file maps](#).

R-Studio can also load and process [images](#) created with the **DeepSpar Disk Imager™**.

Connecting to DeepSpar Disk Imager™ manually

If **R-Studio** cannot find **DeepSpar Disk Imager™**, the Select Interface dialog box will appear. Try to find the DDI interface manually.

3.10.2 DeepSpar USB Stabilizer

This hardware works under Windows 10/11-64 bits

USB Stabilizer is a device that allows any Windows software to reliably work with unstable/degraded USB storage devices providing a connection between the computer and source device. The storage devices can be hard drives, [SSD devices](#), USB memory sticks, memory cards connected through a special adapter, etc. Windows shows such device as if it was connected directly to the system providing access to it for **R-Studio**.

If any drive issue occurs, **USB Stabilizer** handles this issue drive issues preventing the system from freezes, crashes, or disconnecting the drive. Such handling may include various drive resets or even drive repower without system losing the device.

You may learn more about **USB Stabilizer** on its vendor's [USB Stabilizer](#) or [our](#) sites.

Installing USB Stabilizer:

USB Stabilizer Tech/Pro

- 1 **Connect the USB Stabilizer to your computer and power it on**

There should be no device connected.

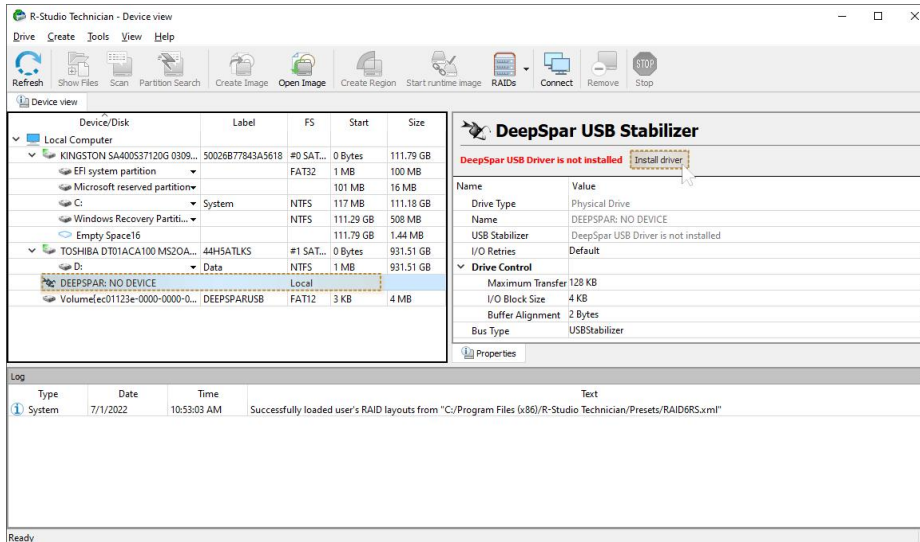

The USB STABILIZER object should appear in the **Safely Remove Hardware** menu when **USB Stabilizer** is connected..

- 2 **Run R-Studio, locate the DEEPSPAR NO DEVICE object in the Device/Disk panel, and click the Install driver button on the Properties tab.**

There should be no device connected.

The [USB STABILIZER](#) object should appear in the Safely Remove Hardware menu

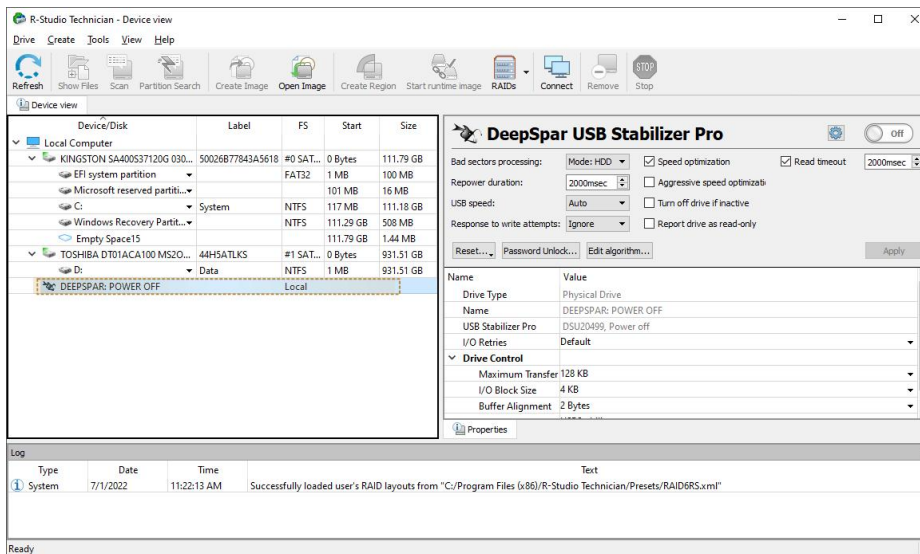

DeepSpar USB Stabilizer

R-Studio will start installing the drivers. You need to restart your system to complete installation.

- > The DEEPSPAR: POWER OFF object will appear in the the Device/Disk panel.

DeepSpar USB Stabilizer

R-Studio is now ready for work with USB Stabilizer.

USB Stabilizer Pro

- 1 Connect the **USB Stabilizer** to your computer and power it on

There should be no device connected.

The USB STABILIZER object should appear in the **Safely Remove Hardware** menu when **USB Stabilizer** is connected..

- 2 Run **USB Stabilizer Control Panel** that comes with **USB Stabilizer Pro** and click the **Install** button.

There should be no device connected.

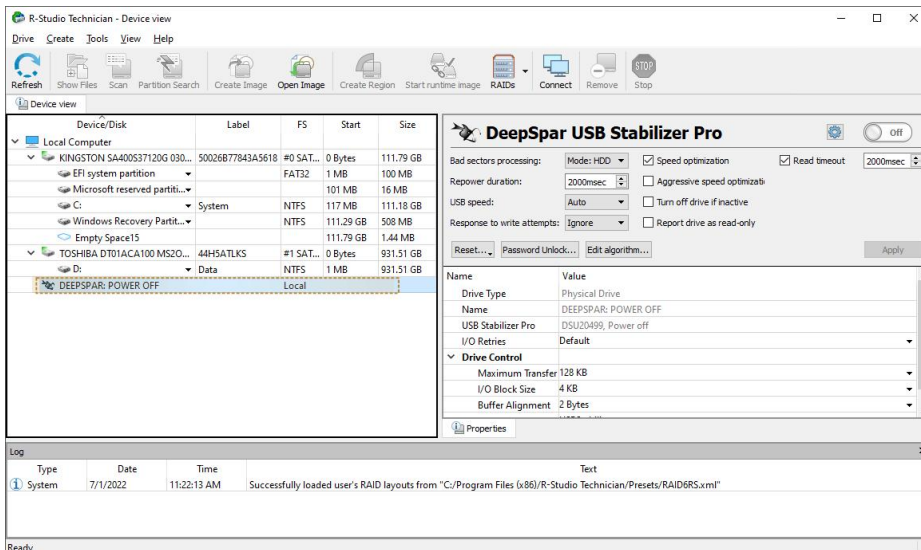

DeepSpar USB Stabilizer Pro

Control Panel will start installing the drivers. You need to restart your system to complete installation.

- > The **DEEPSPAR: POWER OFF** object will appear in the the **Device/Disk** panel.

DeepSpar USB Tech Stabilizer

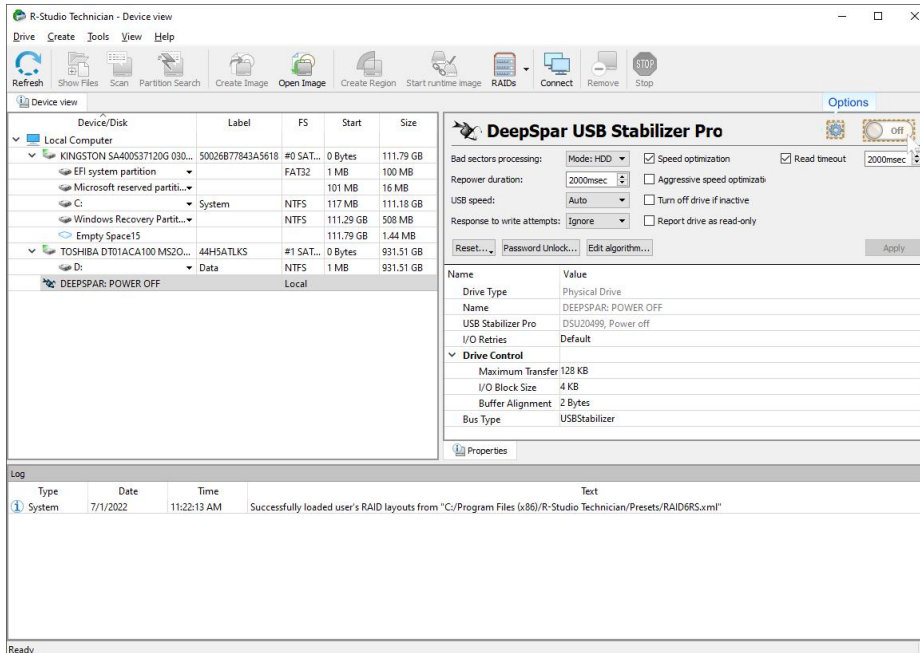

R-Studio is now ready for work with **USB Stabilizer**.

Working with USB Stabilizer:

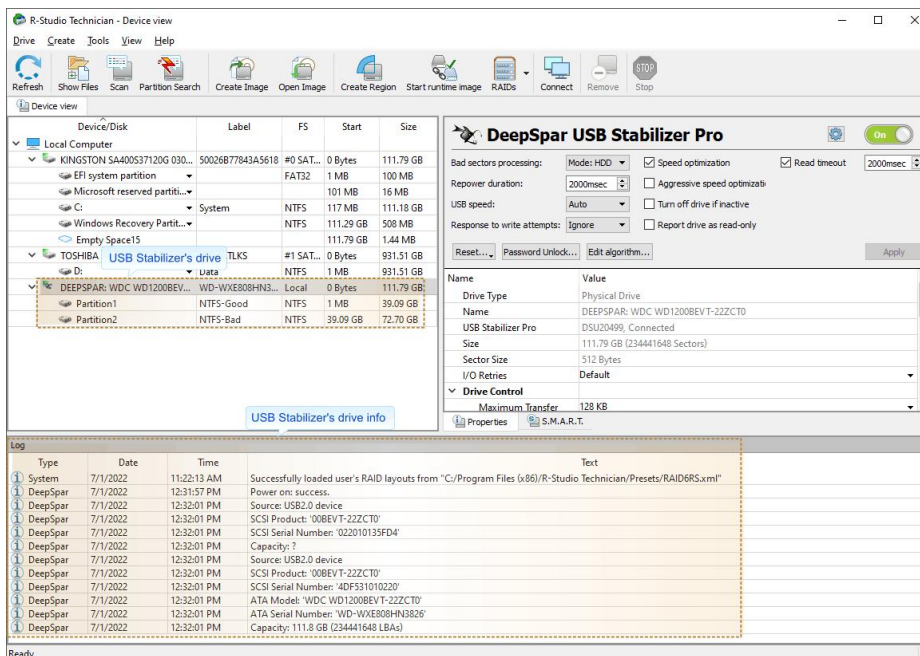

1 Connect the device for recovery to USB Stabilizer and click the Power button

DeepSpar USB Stabilizer

> R-Studio will show the USB Stabilizer's drive.

DeepSpar USB Stabilizer

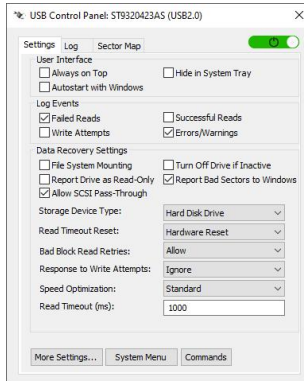

It may take quite a long time to turn the drive on depending on the drive conditions. **R-Studio** will show the **DEEPSPAR: DEVICE IS BUSY** line if there's not enough power for the hard drive to work. That may happen when computer's USB port cannot deliver enough power and the external power supply is disconnected.

R-Studio can now process the **USB Stabilizer drive** as it's a common drive connected to a USB port.

You may read about **USB Stabilizer** parameters in its manual.

You may change other parameters for **USB Stabilizer Pro** through its **Control Panel**.

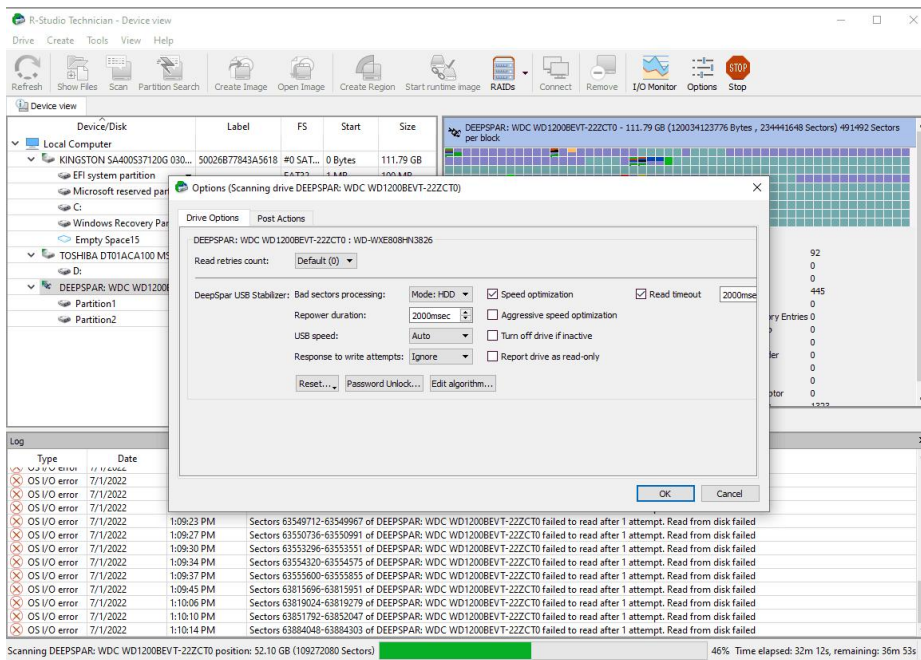

USB Control Panel Stabilizer

Read the **USB Stabilizer Pro** documentation for more details.

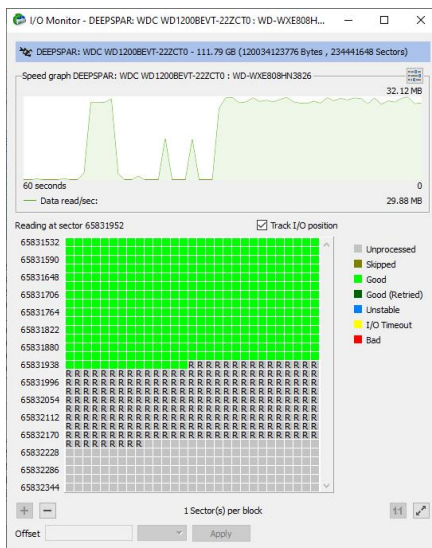

You may change these parameter during drive operations with **USB Stabilizer**.

DeepSpar USB Stabilizer

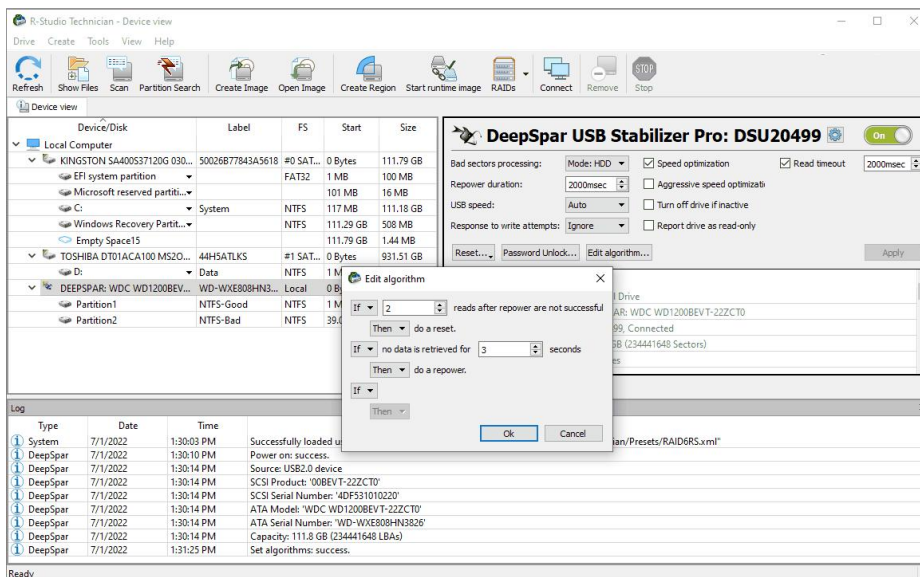

You may also watch drive read operations in real time at the I/O monitor.

.DeepSpar USB Stabilizer

You may specify the algorithm to process faulty drives. Click the **Edit algorithm** button and specify algorithm's parameters.

.DeepSpar USB Stabilizer

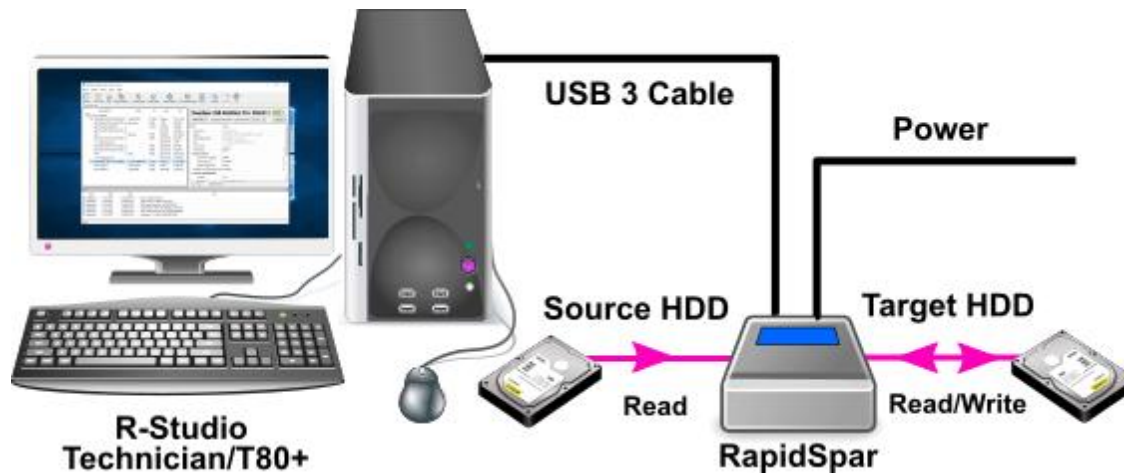

3.10.3 DeepSpar RapidSpar™

RapidSpar is a specialized data recovery device from [DeepSpar](#) intended to extract data from problematic drives. Failing (source) and target drives are connected to the device, and it autonomously copies data from the source to the target in a way that maximizes the amount of successfully extracted data and minimizes possible damage to the source drive. The copy parameters can be quickly changed during this process directly on the device. Then the recovery software can read data from the target drive.

When connected to a PC, the specialized software (including **R-Studio**) can read (and clone) only those drive areas that contain the necessary files and folders to decrease time required for data recovery.

In addition, it's possible to perform some repair works with hard drives.

You may read more about **RapidSpar** on its [web site](#).

RapidSpar doesn't require any installed drivers.

Working with RapidSpar:

- 1 **Connect the source and target hard drives to RapidSpar and start the device.** Refer to the **RapidSpar** manual for detailed instructions.

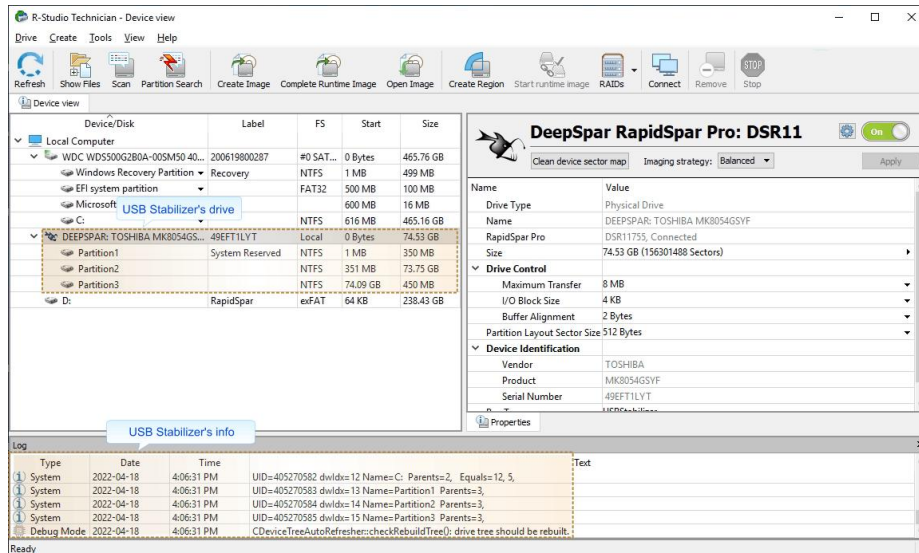

DeepSpar RapidSpar

The screenshot shows the 'Device view' window in R-Studio Technician. The 'Device/Disk' list on the left includes a 'DEEPSPAR: TOSHIBA MK8054GS...' drive. The 'Properties' pane on the right displays the following information:

DeepSpar RapidSpar Pro: DSR11	
Name	Value
Drive Type	Physical Drive
Name	DEEPSPAR: TOSHIBA MK8054GSYF
RapidSpar Pro	DSR11755, Power off
Drive Control	
Maximum Transfer	8 MB
I/O Block Size	4 KB
Buffer Alignment	2 Bytes
Device Identification	
Vendor	TOSHIBA
Product	MK8054GSYF
Serial Number	49EFT1LYT
Bus Type	USBStabilizer

> R-Studio will show the **RapidSpar** drive.

DeepSpar RapidSpar

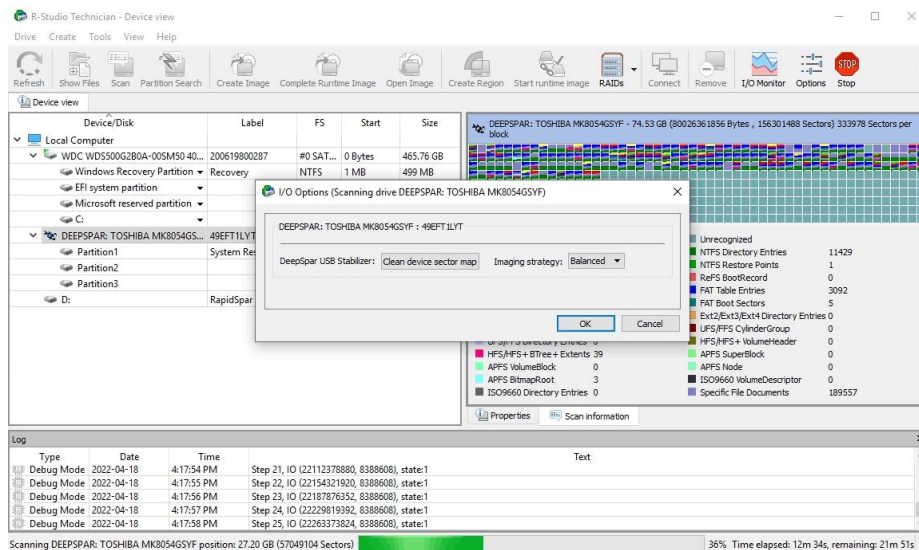

Read the **RapidSpar** documentation for the information about its parameters.

R-Studio can now process the **RapidSpar** drive as it's a common drive connected to a USB port.

You may change these parameter during drive operations with **RapidSpar**.

DeepSpar RapidSpar

You may also watch drive read operations in real time at the I/O monitor.

.DeepSpar RapidSpar

3.10.4 PC-3000 UDMA hardware

PC-3000 UDMA from [ACELab®](#) is a hardware-software solution for hard drive repair and data recovery. Its hardware part is a PCI-Express card that can work with both IDE and SATA hard drives providing access to hard drives with severe physical failures. Its software part is **Data Extractor UDMA** that performs actual data recovery. The **PC-3000 UDMA** card can be used alone for raw data extraction and drive repair.

R-Studio can work directly with the **PC-3000 UDMA** card as an alternative to data recovery software. Our article [Joint work of R-Studio and PC-3000 UDMA hardware](#) explains this in more detail.

3.11 Forensic Mode

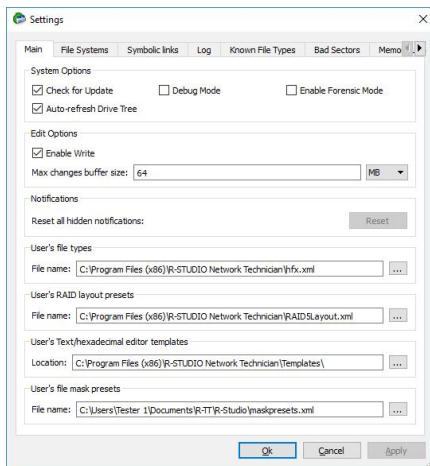

Note: This feature is available for the Technician/T80+ version of **R-Studio** only!

When this mode is enabled, **R-Studio** will generate a [forensic](#) data collection audit log that can be presented at court hearings. This log includes information about a hardware configuration on which the forensic data collection takes place and MD5 for recovered files.

Note: A new log will be generated each time the hardware configuration is changed (a drive is connected/? disconnected, an external USB device is connected/?disconnected, etc)

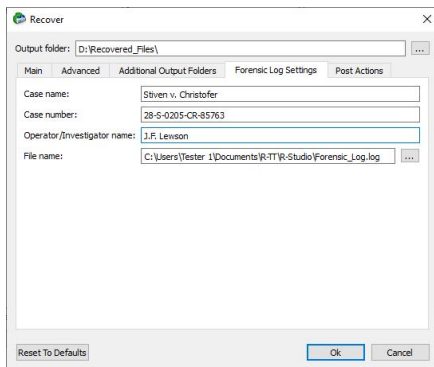

To enable this feature,

- * Select **Enable Forensic Mode** on the **Main** tab of the [Settings](#) dialog box.

The Forensic Log tab will appear on the Recover dialog box.

Forensic Log tab

Enter the required information on this tab and then go to the other tabs of the [Recovery](#) dialog box.

While file recovery, **R-Studio** will create forensic data collection audit log in the specified folder. Below is an example of such log.

```
***** Forensic Data Collection Audit Log
*****
```

R-Studio Technician

```
***** Drives Information
*****
```

```
- Drive Number 0 -----
* Drive Type [256 bytes]: Computer,Local Computer
* Name [30 bytes]: Local Computer
* OS [46 bytes]: Windows 10 Build 19044
* System [136 bytes]: 4 x Intel(R) Core(TM) i5-4570 CPU @ 3.20GHz, 3200 MHz, 16294
MB RAM

IV Text/hexadecimal Editor

Any object visible to **R-Studio** can be viewed and edited in the **Text/hexadecimal editor**. It is also able to parse the data and represent data according to various data patterns. You may also create your own patterns to parse data.

Note: Data alteration is available on the **Technician/T80+** and **Corporate** versions only.

You may turn [numerical indexes](#) for objects to distinguish them better.

4.1 Viewing and Editing Objects

**YOU MUST BE ABSOLUTELY SURE OF WHAT AND WHERE YOU ARE WRITING!
Or you may completely lose all your data.**

Before you can physically write anything on a drive, you need to enable writing.

To enable writing,

- 1 In the **R-Studio** main panel, select the **Tools** menu, then **Settings**, and select **Enable Write** on the [Settings](#) dialog box.
 - > **The Editable: status will change to Yes from Read Only.**
Now the object can be edited.

Locking and unlocking objects

It is possible to manually lock an object being edited in **Text/Hexadecimal Editor**.

When an object is locked, **Text/Hexadecimal Editor** has an exclusive access to it, and no other programs or Windows can make any changes on it. **Text/Hexadecimal Editor** itself always locks the object itself before writing anything on the drive and then unlocks it. But sometimes locking/unlocking may take quite a lot of time, up to several seconds. That is why sometimes it is a good practice to lock an object while editing it in **Text/hexadecimal Editor**. This can be done by selecting **Lock** on the **Tools** menu.

When considering locking an object in **Text/Hexadecimal Editor**, keep in mind the following:

- Starting from Windows 7, it is impossible to change data if it resides on a [logical disk](#) without locking the drive. If the data is on a place outside of any logical disk (on an unmounted [partition](#) or empty space), such lock is not necessary. Windows Vista, XP, or below do not have such restrictions.
- The **Lock** command tries to lock all logical disks on which the object being edited is placed. For a drive, those are all its logical disks, for a file that is a logical disk where it resides. And if a RAID is created from logical disks and a file is opened on that RAID, **Text/Hexadecimal Editor** blocks all logical disks on which the file resides.

Moreover:

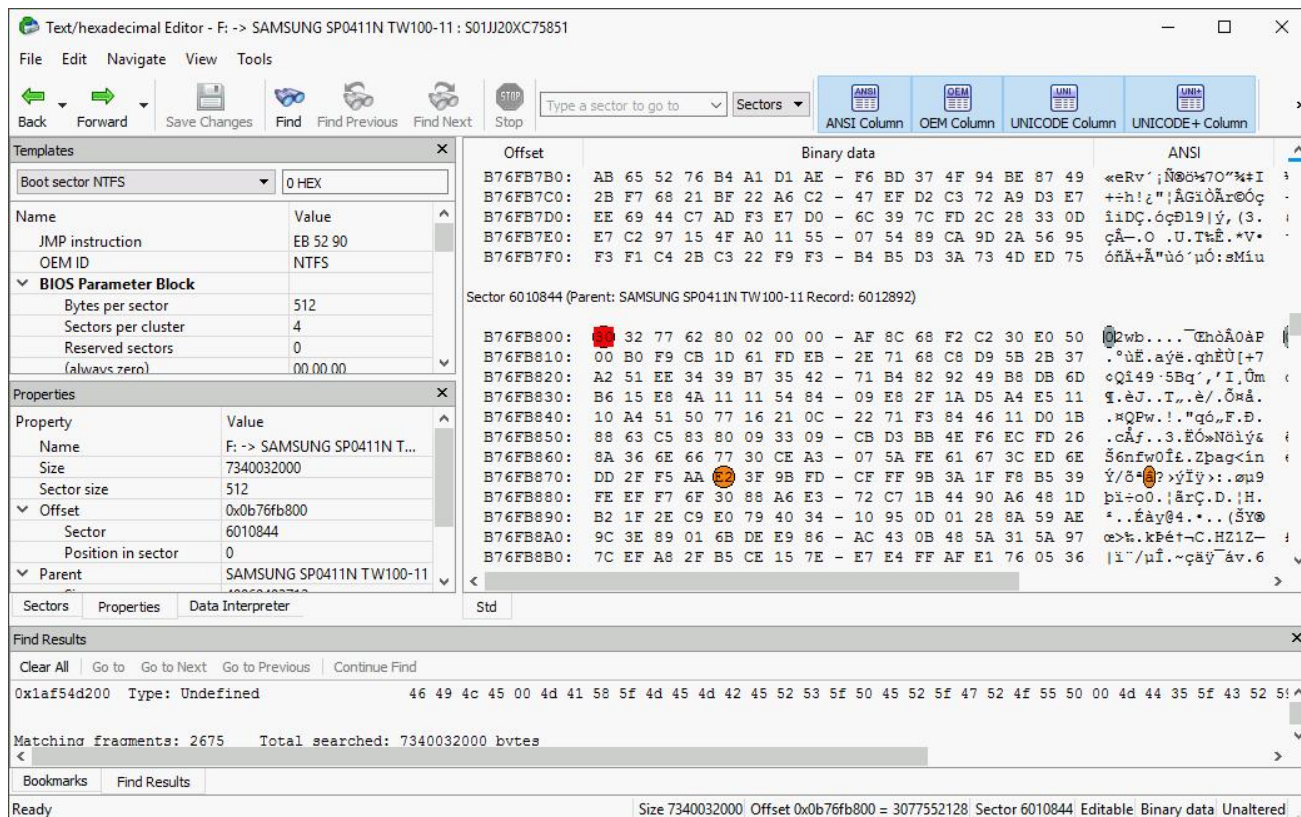

- If a logical disk is opened in **Text/Hexadecimal Editor**, the **Lock** command locks the drive if there is no files opened by some other programs.
- If a drive is opened in **Text/Hexadecimal Editor**, the **Lock** command locks the drive if all its logical disks can be locked. That may cause problems is one of the logical disks is a system one.

To view/edit an object,

- 1 **Right-click the object and select View/Edit on the shortcut menu**
 - ☐ **Other ways to view/edit the object**
 - Select the object and select **View/Edit** on the **File** menu
 - or
 - Select the object and press the **Ctrl+E** keys

> A Text/Hexadecimal Editor panel will appear

R-Studio Text/Hexadecimal editor

Text/Hexadecimal Editor status

Previous Pattern

Click this button to go to the previous pattern.

Next Pattern

Click this button to go to the next pattern.

Save Changes

Click this button to save changes.

Code pages

Turns supported code pages on/off.

Autoflow

Click this button to turn autoflow on.

Panel view options

You may set which panels and bars to enable/disable.

To enable/disable:

ANSI data	Select/clear ANSI on the View menu
OEM data	Select/clear OEMr on the View menu
UNICODE data	Select/clear UNICODE on the View menu
UNICODE+ data	Select/clear UNICODE+ on the View menu
Toolbar	Select/clear Toolbar on the View menu
Properties View	Select/clear Properties View on the View menu
Sectors View	Select/clear Sectors View on the View menu
Data Interpreter View	Select/clear Data Interpreter View on the View menu
Template View	Select/clear Template View on the View menu
Bookmarks View	Select/clear Bookmarks View on the View menu
Find Results View	Select/clear Find Results View on the View menu

2 View the information and make necessary changes

Select **Save Changes** on the **Tools** menu if you want to save changes.

Other ways to save changes

- Select **Save Changes** on the **File** menu
- or
- Press the **Ctrl+S** keys

Viewing

There are up to four tabs showing the data in different representations. Actual number of tabs depends on the object and property being viewed/edited.

Std	Exact attribute data. If the attribute is compressed, R-Studio decompresses it prior to showing.
Unlimited	Exact attribute data + free space of last cluster. If the attribute is compressed, R-Studio decompresses it prior to showing.
Direct	Actual data written on the drive. If the attribute is not compressed, it coincides with the Std representation.
Allocation	Resident part of the attribute.

You may view data in 4 various code pages: ANSI/OEM/UNICODE/UNICODE+ by switching on/off the respective code pages in the **Code pages** buttons or select the appropriate code pages on the **View** menu.

You may see which file is written on a particular sector. See [Files and Sectors](#) for details.

Patterns or Templates

You may select a pattern according to which the data will be parsed and shown in the parsed data pane. The Data Interpreter shows the data selected in the Template pane in various representations.

You may find the next or previous data that matches the pattern signature on the drive. Right-click the right pane of the editor and select either **Find Template Signature Next** or **Find Template Signature Previous** on the shortcut menu. You may also select these items on the **Edit** menu.

You may also [create](#) your own patterns to parse data from various objects.

Navigating

Text/Hexadecimal Editor gives you various ways to navigate into an object. See the [Navigating through an Object](#) for more details.

Data Copy

Text/Hexadecimal Editor gives you various ways to copy selected data navigate in an object. See the [Data Copy](#) for more details.

Filling an area with a pattern

To fill an area with a pattern, select **Fill** on the **Edit** menu, and specify the pattern and area on the Fill dialog box.

Fill dialog box

Fill options

Fill pattern	
HEX	Field for the pattern to fill the area in the hexadecimal representation
ANSI	Field for the pattern to fill the area in the ANSI encoding
OEM	Field for the pattern to fill the area in the OEM encoding
UNICODE	Field for the pattern to fill the area in the UNICODE encoding
Fill range	
From (hex)	Field for the start position of the area to fill with the pattern
To (hex)	Field for the end position of the area to fill with the pattern

3 Click the **Save Changes** button to save the changes

Other ways to save the changes made

- Select **Save Changes** on the **Edit** menu

or

- Press the **F2** key

> **Viewer/Editor** will save the changes on the object

YOU MUST BE ABSOLUTELY SURE OF WHAT AND WHERE YOU ARE WRITING!
Or you may completely lose all your data.

Selecting and saving an area in the **Viewer/Editor**

You may select an area in the **Viewer/Editor** panel and save it as a file.

To select and save an area in the **Viewer/Editor** panel,

1 Right-click the beginning of the selection and select **Select From** on the shortcut menu

2 Right-click the end of the selection and select **Select To** on the shortcut menu

Other ways to select an area

- Select **Select...** on the **Tools** menu and specify an area to select on the **Select** dialog box,

OR

- Click the start point of the area and drag the mouse cursor to its end.

If you need to select an entire object, select **Select All** on the **Tools** menu or click the **Ctrl+A** key

Select dialog box

- 3 Select an appropriate item in the **Tools** menu to save the data in a required format and specify its file name

Select:

Save to Binary File...	to save the data in the binary format (default extension is <code>.bin</code>)
Save to Hexadecimal File	to save the data in the binary format (default extension is <code>.hex</code>)

on the **Tools** menu.

If you select an existing file, **R-Studio** will ask you if you want to append or overwrite the file.

If a remote computer is connected for [Data Recovery over Network](#), the Save as... dialog box will appear when you select a place to save the data. You may save it to the local or remote computer.

- > **Viewer/Editor will save the data in the file**

Loading data from an external file

You may load a data from a file and overwrite an area of the object opened in the Viewer/Editor panel.

To load binary data from a file and overwrite an area of the object opened in the Viewer/Editor panel,

- 1 Select an area to overwrite and select **Load from File...** on the **Tools** menu

If a remote computer is connected for [Data Recovery over Network](#), the Open as Binary File dialog box will appear when you select a place to open the data file from. You may open it from the local or remote computer.

- 2 Select the necessary file and load the data.

> The area in the Viewer/Editor will be overwritten with the new data.

4.2 Navigating through an Object

Navigating

You may quickly move to a particular part of the object. To move to a particular part of the object being viewed/edited, enter the required offset in the **Go to Offset** field between the buttons.

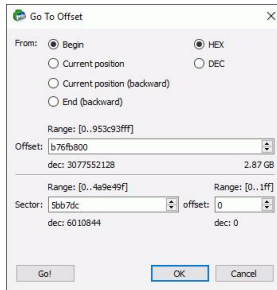

Type an offset to which you want to go. You may select between bytes and sectors. See the [Data Formats and Multipliers](#) topic for more details on data formats.

If a file is opened in **Text/Hexadecimal Editor**, you may select data representation for that file.

Type a sector to go to Sectors DATA: DATA (NR)

You may also use the Go To Offset dialog box to go to a specified place in the object. Click the Offset field on the **Status** bar. You may also use this dialog box to copy the offset.

Go To Offset dialog box

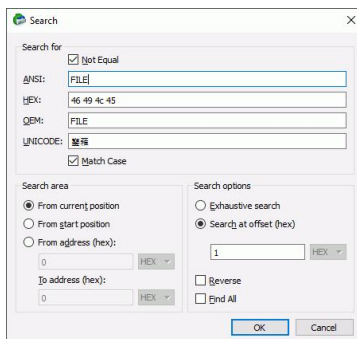

Go To Offset options

From:	Jump/offset direction. For example, if you need to find the offset from the object end for a selected byte, switch to the End (backward) option.
HEX/DEC	Switch between the hexadecimal and decimal data representation.
Range	Range of values that can be entered.
dec/hex:	Alternative data representation.
Offset:	Flat data offset (without separation between the sector and offset in the sector).
Sector/offset	Data offset represented as a sector and offset in the sector.
Go!/OK buttons	The Go! button moves the cursor to the specified positions, but the Go To Offset dialog box remains open. The OK button closes the dialog box after moving the cursor.

Searching

To search for a particular string, click the **Find**, **Find Next**, or **Find Previous** buttons or the same items on the **Edit** menu, and specify the string on the Search dialog box.

Search dialog box

▣ Search options

Not Equal	Search for the place which content is not equal to the string. For example, the first byte not equal to 00 or FF.
Search for	
HEX	Field for the string to search for in the hexadecimal representation
ANSI	Field for the string to search for in the ANSI encoding
OEM	Field for the string to search for in the OEM encoding
UNICODE	Field for the string to search for in the UNICODE encoding
Match case	Select this check box to make the search case-sensitive
Search area	
From current position	Select this check box to start search from the current position
From start position	Select this check box to start search from the beginning of the object
From Address	Select this check box and specify the range in which the search is to be carried out
Search position	
Exhaustive search	Select this check box to search the entire object
Search at offset	Select this check box and specify the sector offset from which the search will start
Reverse	Select this check box to start the search in the reverse direction
Find all	Select this check box to search for all instances of the string to search. Search results will be shown in the Find Results pane.

Text/Hexadecimal Editor will show the search progress.

Search results are shown in the Find Results pane. You may easily move to the required found item by clicking the item.

▣ Features of the Not Equal option

Suppose we have an object which first 3 consecutive sectors start with:

```
Sector1  FILEAAAAA.....
Sector2  FILEBBBBB.....
Sector3  NOTAFILE.....
```

And the search string is Not Equal FILE.

If the Exhaustive search option is selected, the **Text/Hexadecimal Editor** will stop at the first A character in Sector1.

If the Search at offset=0 option is selected, the **Text/Hexadecimal Editor** will stop at the N character in Sector3.

Bookmarking

You may create bookmarks to easily move to those places. Right-click the cursor on the place you want to bookmark and select **Toggle Bookmark** on the shortcut menu. The list of bookmarks appears in the Bookmark pane. You may easily move to the required bookmark by clicking it in the list.

You may control bookmarks on the **Edit** menu.

4.3 Data Copy

Text/Hexadecimal Editor gives you various ways to copy selected data navigate in an object.

Data selected in Text/Hexadecimal Editor

Depending on what column you have control-clicked, the following commands are available in the shortcut menu:

When right-clicking any column Copy Editor Display	Data pasted into a text editor
When right-clicking any column Copy as File Signature	Data pasted into a text editor
When right-clicking the Binary data column Copy as "Binary data"	Data pasted into a text editor
When right-clicking the ANSI column Copy as "ANSI"	Data pasted into a text editor
When right-clicking the UNICODE column Copy as "UNICODE"	Data pasted into a text editor

4.4 Files and Sectors

You may see which file is written on a particular sector. To do so:

- 1 Enumerate files on a logical disk in the Drives panel.
 - 2 Go to the tab of that logical disk and select Show Files in HexEditor on the Files menu.
 - 3 Return to the Drives panel and select View/Edit on the shortcut menu.
- > R-Studio will show a file that belongs to a particular section.

4.5 Creating Custom Patterns

You may create your own patterns yourself.

[An example of a commented pattern parsing an AVI file.](#)

The syntax of pattern description is similar to that of the XML language. The folder where the files should be placed is specified on the Main tab of the [Settings](#) dialog box.

Pattern structure

Pattern header

Each pattern starts with a standard header

```
<?xml version="1.0" encoding="utf-8"?>
```

Section template

Each pattern starts with a section giving to the pattern a name that will be shown in the parsed data pane.

Attributes:

name	Specifies the pattern name shown in the parsed data pane
------	--

Example:

```
<template name="AVI File LIST">
  .....
</template>
```

Section signature

Attributes:

align <positive integer>	Specifies if the data structure address is aligned (i.g., by a sector: 512)
--------------------------	---

This section contains elements `field` with hex-codes of the signature. The attribute `offset` specifies their offset from the start of the record. Field length is equal to the number of hex-codes.

Example:

```
<signature align="1">
  <field offset="0">46 49</field>
  <field offset="2">4c 45</field>
</signature>
```

Section section

Such sections contain all expressions and operations needed for the pattern to parse the data. A section name is shown in the parsed data pane. In fact, sections are virtual objects used to group logically connected `fields`. Sections can be nested.

The main section is not shown in the parsed data pane.

Section contain elements `field` which are actual data objects. `field` names are shown in the parsed data pane with their values.

Attributes:

name	Specifies the pattern name shown in the parsed data pane
------	--

Example:

```
<section name="JUNK">
  ....
</section>
```

List of All Objects in Patterns

Data types (in `field`)

- integer

Sub-types:

```
int8
int16
int32
int64
uint8
uint16
uint32
uint64
uintX
```

Attributes:

endian: (be le system)	Optional. Default: <code>system</code> .
base: (decimal hex octal)	Optional. Specifies data representation. Default: <code>decimal</code> .
as-offset: <expression>	Optional. Specifies that this field is an offset and its value should be evaluated using the expression. A special variable <code>this</code> returns the value of this field.
purpose: (offset rsector sector cluster rcluster)	Optional. Specifies the type of the <code>as-offset</code> expression result . If this attribute is present, the attribute is necessary if the offset value should differ from the value of this field (variable <code>this</code>). <code>rsector</code> and <code>rcluster</code> are offsets relative to the absolute position of the pattern beginning.
assigned-template: <TemplateName>	Specifies the pattern name linked with this field. Ignored if the <code>as-offset</code> or <code>purpose</code> attributes are not specified.
var: <Name>	Optional. Specifies the name under which the value of this field can be accessed in expressions.

- binary

Attributes:

display-encoding: (hex binary)	Optional. Default: hex.
size: <bytes>	Mandatory.

- char

Attributes:

size: <bytes>	Mandatory.
codepage: (ansi oem utf8 utf16)	Optional. Specifies which codepage is used. Default: ansi.

- filetime

Shows time in the Win32 format (64 bits)

- unixtime

Shows time in the Unix format (seconds from 01/01/1970)

- filetime

Shows time in the DOS format (date: hiword, time: loword)

- bits

Attributes:

size: <bytes>	Mandatory.
pos: <comma separated list of bit positions>	Mandatory. Specifies bit positions in a data block.

Commands

- goto

Specifies a jump to a specified offset (either absolute or relative one)

Attributes:

address: <expression>	Specifies an absolute address to jump to.
offset: <expression>	Specifies a relative offset to jump by.

One and only one of the attributes should always be specified.

- if

Evaluates a condition specified in the `test` attribute and, if the condition is true, reads fields specified in this tag.

Attribute:

test: <expression>	Sets a condition to test against.
--------------------	-----------------------------------

- repeat

Reads the fields specified in the tag until the exit condition is equal to 0 or specified times

Attributes:

count: <expression>	<expression> is evaluated one time upon entering the block. Internal elements are read the specified number of times.
test: <expression>	<expression> is evaluated upon entering the block. Similar to the C++ construction <code>while(...) {}</code> .
test: <expression>	<expression> is evaluated upon exiting the block. Similar to the C++ construction <code>do {} while(...)</code> .

- `setvar`

Sets the value of an internal variable. As an example, this command is convenient to store the current offset. The value of the current offset is stored in a predefined variable `offset`.

Attributes:

var: <string>	Specifies the name of the variable.
expr: <expression>	Specifies an expression which result will be assigned to the variable.

Expressions

Expressions in the patterns are arithmetic expressions which syntax is similar to that of the C language, including operation preceding.

The following operations are supported:

+ - * / & | > < <= >= != == || &&

Predefined variables

- `offset`

An offset in bytes from the pattern beginning data is currently read at.

- `start_position`

An absolute position of the pattern beginning. `offset + start_position = absolute offset`.

- `this`

This variable exists only within the context of the `ass-offset` expression evaluation and is the current value of the data field for which that expression is specified

4.6 Pattern Example I

Below is an example of a commented pattern parsing an AVI file.

```
<?xml version="1.0" encoding="utf-8"?>
<!-- A pattern section. The pattern name is AVI File. -->
<template name="AVI File">
  <!-- A template signature section. Alignment is 1. -->
  <signature align="1">
    <!-- A 4-byte signature at offset 0x00. -->
    <field offset="0x00">52 49 46 46</field> <!-- ANSI: RIFF -->
    <!-- A 4-byte signature at offset 0x08. -->
    <field offset="0x08">41 56 49 20</field> <!-- ANSI: LIST -->
```

```
</signature>

<!-- A data section. Its name is AVI File. This is the main data section. It is not shown in the parsing tree as
a section (its name is ignored). -->
<section name="AVI File">
  <!-- The first 4 bytes are read and shown as an ANSI string. -->
  <field type="char" size="4" name="Signature: RIFF" var="signature"/>
  <!-- The current position is moved to the beginning of the file. -->
  <goto offset="-4"/>
  <!-- The first 4 bytes in the file are read and shown as an unsigned integer. The internal variable signature
gets the value of the field. -->
  <field type="uint32" base="hex" name="Signature RIFF as unsigned integer in hex
format" var="signature"/>

  <!-- A test against the condition (signature == RIFF) -->
  <if test="signature == 0x46464952"> <!-- ANSI: RIFF -->
    <!-- The next 4 bytes are read and shown as an unsigned integer. The internal variable dataSize gets
the value of the field. -->
    <field type="uint32" name="Size of the data in file" var="dataSize"/>
    <!-- A new internal variable endOfFile is created and the expr field evaluates its value.-->
    <setvar var="endOfFile" expr="offset + dataSize - 8"/>
    <!-- The next 4 bytes is read and shown as an ANSI string. -->
    <field type="char" size="4" name="File type"/>

  <!-- A new section named DATA is created -->
  <section name="DATA">
    <!-- A new internal variable chunksOffset is created, the expr field evaluating its value. This variable
gets the absolute value of template offset. -->
    <setvar var="chunksOffset" expr="start_position"/>

    <!-- A loop is created. Its condition is set in the test field (while the endOfFile variable is greater
then the current position.) -->
    <repeat test="endOfFile > offset">
      <!-- 4 bytes are read and shown as an ANSI string. -->
      <field type="char" size="4" name="Signature"/>
      <!-- The current position is moved backwards by 4 bytes. -->
      <goto offset="-4"/>
      <!-- The same 4 bytes are read and shown as an unsigned integer. The internal variable signature
gets this value. -->
      <field type="uint32" name="Signature as unsigned integer"
var="signature"/>

```

```

<!-- A test against the condition (signature == LIST) -->
<if test="signature == 1414744396"> <!-- ANSI: LIST -->
  <!-- The section is shown. Its name is LIST -->
  <section name="LIST">
    <!-- The current position is moved backward by 4 bytes. -->
    <goto offset="-4"/>
    <!-- The 4 bytes are read and shown as an unsigned hexadecimal integer. This field has the
attributes offset and assigned-template. If the user double-clicks this field, the AVI File LIST pattern
will be invoked and the current pattern position will be moved to the address specified in as-offset.-->
    <field type="uint32" base="hex" name="Signature LIST as unsigned
integer in hex format" as-offset="start_position + offset - 4" assigned-
template="AVI File LIST"/>
    <!-- The next 4 bytes are read and shown as an unsigned integer. The listSize variable gets
its value. -->
    <field type="uint32" name="Size of the data in the list"
var="listSize"/>
    <!-- The 4 bytes are read and shown as an ANSI string. -->
    <field type="char" size="4" name="List type"/>
    <!-- The current position is moved backward by 4 bytes. -->
    <goto offset="-4"/>
    <!-- The same 4 bytes are shown as an unsigned hexadecimal integer. The listType variable
gets its value.-->
    <field type="uint32" base="hex" name="List type as unsigned integer in
hex format" var="listType"/>

    <!-- A test against condition (type == movi) -->
    <if test="listType == 0x69766f6d"> <!-- ANSI: movi -->
      <!-- The chunksOffset variable gets the value evaluated in the expr attribute. -->
      <setvar var="chunksOffset" expr="start_position + offset - 4"/>
    </if>

    <!-- The current position is moved to the address evaluated in the address attribute. -->
    <goto address="offset + listSize - 4"/>
  </section>
</if>

<!-- A test against condition (signature == JUNK) -->
<if test="signature == 1263424842"> <!-- ANSI: JUNK -->
  <!-- The section is shown with the JUNK name. -->
  <section name="JUNK">
    <!-- The next 4 bytes are read and shown as an unsigned integer. The internal variable
junkSize gets its value. -->

```

```
                <field type="uint32" name="Size of the data of the junk"
var="junkSize"/>
        <!-- The current position is moved by junkSize bytes forward. -->
        <goto offset="junkSize"/>
    </section>
</if>

<!-- A test against condition (signature == idx1)-->
<if test="signature == 829973609"> <!-- ANSI: idx1 -->
    <!-- The section is shown with the idx1 name. -->
    <section name="idx1">
        <!-- The next 4 bytes are read and shown as an unsigned integer. The internal variable
idxSize gets its value. -->
                <field type="uint32" name="Size of the data of the idx1"
var="idxSize"/>

[R-Studio Agent Emergency](#)

5.1 IntelligentScan Technology

R-Studio uses a unique *IntelligentScan* technology when it tries to recover the data on the area being scanned.

While scanning the selected area, **R-Studio** reads data directly from the drive, analyzes them, and tries to determine a record to which the data belong. The following record types are possible:

- MBR/GPT records
- NTFS Boot Sector, Folder, and MFT records
- [FAT/exFAT](#) Boot Sector, folder, and file records
- ReFS Boot sector records and ReFS Meta blocks
- HFS/HFS+ Volume headers and BTree+ nodes
- APFS Super blocks, APFS Volume blocks, and APFS nodes
- Ext2/3/4FS SuperBlocks records
- [UFS/FFS](#) SuperBlock records
- Specific file signatures of [Known File types](#) for raw file carving

All these record types have different, but known, structure. Knowing valid values of record fields and relations between them for each record type, **R-Studio** determines a record type for the data. If such record type cannot be unambiguously determined, the data are assigned to the most probable record type. The same data can be assigned to several record types, with a certain probability for each assignment. A list of possible files is generated from these records.

R-Studio generates a record list for each record type. This list contains references to records assigned to a record type from the list with their assignment probability. The same data can be included into different record lists. Then **R-Studio** analyzes relations between elements in each list and between different lists, and generates a list of found [partitions](#) with their parameters, such as partition start point and probable size, file system type, cluster size, and existence probability.

Using the file list and partition list, **R-Studio** reconstructs file systems and files on the found partitions. One file can be attributed to several different partitions.

When the entire drive or its part has been scanned, **R-Studio** shows all found partitions. Then the parameters of the found partitions may be manually corrected, if additional information on them is available.

Using the *IntelligentScan* technology, **R-Studio** can recover files not only on new and existing partitions. It also can find and recover data on partitions that have been deleted or [reformatted](#). If, for example, there was an NTFS partition, which later was reformatted as a FAT partition, **R-Studio** will show two partitions on the same place on the drive, one having the FAT file system, the other the NTFS. Then, files found on those partitions can be recovered.

The *IntelligentScan* technology makes **R-Studio** a very powerful data recovery tool, but it is not omnipotent. As it uses probabilistic approach to data reconstruction, it cannot guarantee 100% correct results. Moreover, even if **R-Studio** has reconstructed data structure correctly, it is impossible to guarantee that all found files will be completely and correctly recovered, as new data may be already written over the old files. See the [Data Recovery Issues](#) topic for details.

5.2 Data Recovery Issues

NEVER TRY TO SAVE RECOVERED FILES/FOLDERS TO THE SAME LOGICAL DISK WHERE THEY RESIDE!!!

Or you may obtain unpredictable results and lose all of your data.

R-Studio writes directly to a drive only when writing recovered data and from its hex editor, if writing is enabled. In all other actions, **R-Studio** only reads data and analyzes them, and never modifies data on the drives being analyzed.

Most operating systems use lazy-write. So, there is a time lag between file actions and actual changes on data on a drive. **R-Studio** analyzes data on drives only. That is why it does not always detect recent changes in data structure.

Most operating systems constantly write their service information on drives. Such writing is especially intensive during startup and shutdown procedures. When an operating system deletes a file/folder, it treats the space where it has resided as empty and may write something in this place. If this happened, the file/folder and its parameters may be detected correctly, but its data may be lost.

Folder names like **\$\$\$Folder58448** on NTFS [partitions](#) mean that the folder has not been found on the drive but some references to it have been. For example, folders My documents, Work, Photos have been found and all they have one parent folder, whose description has not actually been found on the drive, so its name is unknown and therefore represented as **\$\$\$Folder58448**. It may happen that the description of such folders was outside of the

scan area, so try to enlarge the region or scan the entire drive. If that does not help, most likely that the description of the folder has been overwritten.

Folder names like **\$ROOT58448** on [FAT](#) partitions mean that some folders have been found, but they cannot be included into the folder structure for this FAT partition. Sometimes, such folders may contain other folder structures.

If you recover a file, and it appears that the file contains wrong data, try to do the following:

- **Scan:**

- the [logical disk](#), if the file has been just deleted.

- the drive, if the data structure is damaged more seriously.

- **Search for the file** to be restored on all found partitions and try to recover it from all found partitions.

- Check each recovered file to ensure that it contains correct data. As soon as you found the partition from which the file is recovered correctly, use this partitions to recover all other deleted files.

If there are several deleted files to be restored, you should use a file larger than 2KB to select the required partition.

FAT file system:

Cross-Linked Folders

Often **R-Studio** finds several FAT folder records that contain the same data. Such folders are called *cross-linked*. **R-Studio** marks such folders with an arrow mark:   Movie

R-Studio attributes the content of cross-linked folders to one folder called a *target folder*. When recovering, **R-Studio** places the content to the target folder.

To view the list of cross-linked folders,

- 1 **Right-click a cross-linked folder and select Cross Linked Folders on the shortcut menu**

> **A list of cross-linked folders will appear**

You may go to any folder in this list by clicking it.

To find a target folder,

- * **Right-click a cross-linked folder and select Go Target on the shortcut menu, or**

- Select the cross-linked folder and select **Goto Target** on the **File** menu

- If **Go Target** is gray, this folder is already the target folder.

To set the target folder manually,

- * **Right-click a cross-linked folder and select Set As Default Target on the shortcut menu, or**

- Select the cross-linked folder and select **Set As Default Target** on the **File** menu.

- If **Set As Default Target** is gray, this folder is already the target folder.

Questionable Folders

Sometimes, **R-Studio** may find FAT records, which look like folders, but their content is invalid. For example, file names have invalid characters, date, time, and size, or other file attributes may look strange. Please note that **R-Studio** correctly recognizes localized names. **R-Studio** treats such records as folders, but does not analyze their content and structure. You can manually scan such folders, but results may be unpredictable. Usually, such scan reveals garbage.

R-Studio marks such folders with a question mark.   ?MP

To re-scan an object,

- * **Right-click a questionable folder in the R-Studio's Folders panel and select Rescan on the shortcut menu, or**
 Select the questionable folder and select **Rescan** on the **File** menu.

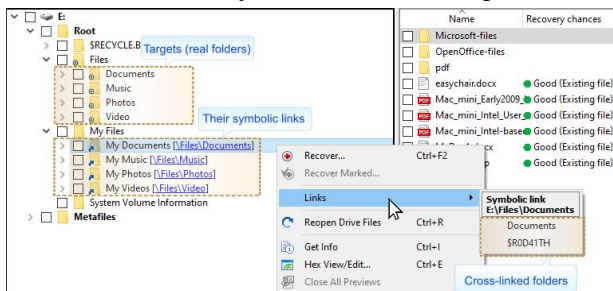

ReFS, NTFS, APFS, HFS, XFS, and ext fs file systems:

Symbolic links (symlinks)

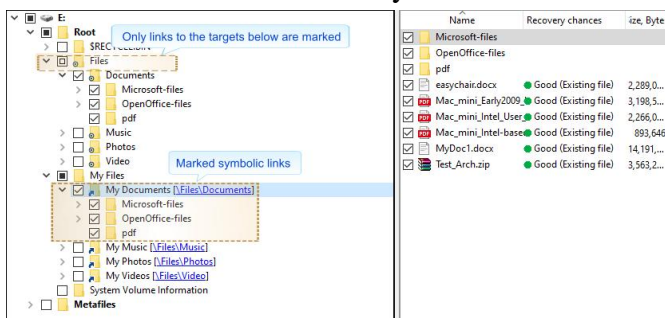

[Symbolic links](#) (of symlinks for short) are object that contains references to other files or folders directory in the form of absolute or relative paths and that affect pathname resolution. For example, if a symlink `c:\ProgramData\Documents` points to `D:\Recovered Files\Root\Users\Public\Documents`, entering it will result in entering `D:\Recovered Files\Root\Users\Public\Documents`.

They are present in almost all modern file systems. NTFS, HFS+, APFS, and EXT FS are probably the most popular examples.

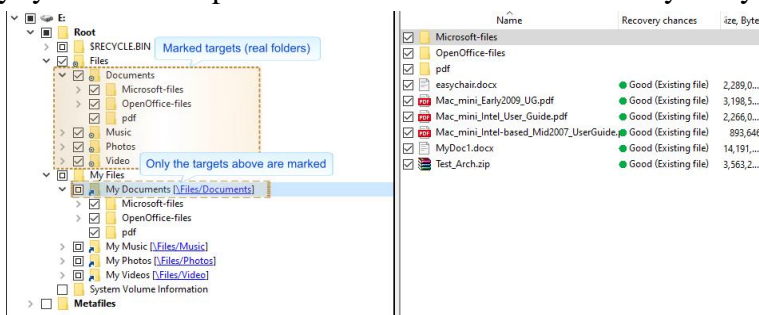

R-Studio shows such symlinks and their targets in the following way:

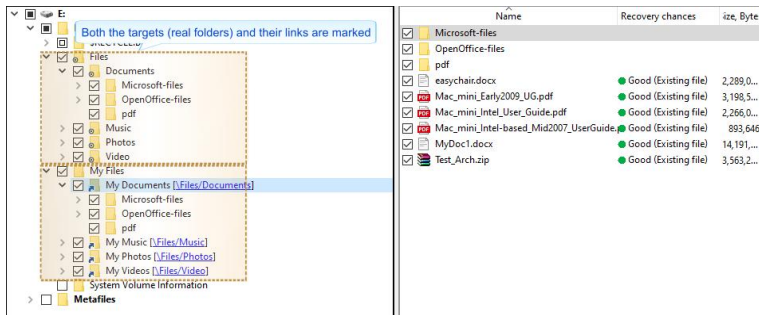

Symlinks can be marked for recovery

Only symlinks on the picture above are marked for recovery. They will be recovered as real files and folders.

Only targets (real folders) on the picture above are marked for recovery. They will be recovered as real files and folders.

Both targets (real folders) and symlinks on the picture above are marked for recovery. They will be recovered as real files and folders and symlinks.

The [R-Studio Settings](#) topic gives more details about symlink recovery.

Files:

Hard links

[Hard links](#) are file system entries that give file names to files. This term is usually used when files may have several names. **R-Studio** shows hard links using the following icons:

A hard link:  Wipe Test 2.doc

The target file:  Wipe Test 2.doc

You may find a target or [hard link](#) for a file. Right-click the file and select **Links** on the shortcut menu.

5.3 Extended Information Recovery

R-Studio supports recovery of compressed files, [alternative data streams](#), encrypted files, file security and extended file attributes. If the **R-Studio** host OS and the file system of the disk you are going to save file to support any particular extended information, it will be saved with the file, too. Otherwise, the extended information will be saved as separate files with the same name as the restored file and extension showing the type of the extended information. Below is a quick reference for the host OS and file system of the target drive.

Extended Information	Required host OS	Required target disk FS
Encrypted files	Windows 2000/XP/2003/Vista/? 2008/7/8/8.1/10	NTFS
Alternative data streams	Windows NT/2000/XP/2003/? Vista/2008/7/8/8.1/10	NTFS
File security	Windows NT/2000/XP/2003/? Vista/2008/7/8/8.1/10	NTFS
Extended file attributes	Windows NT/2000/XP/2003/? Vista/2008/7/8/8.1/10	NTFS or FAT/exFAT

5.4 Data Formats and Multipliers

You may enter data in all numerical fields either in sectors or in bytes. If there is no letters are after the number, **R-Studio** assumes the numbers are in bytes.

Decimal numbers are entered as they are: 2372354

Hexadecimal numbers are entered as 0x23Fa67 Or 23Fa67 hex.

The following case-insensitive notation is possible:

b	1 byte
kb	1 kb = 2 ¹⁰ =1024 bytes
mb	1 mb = 2 ²⁰ =104857 bytes
gb	1 gb = 2 ³⁰ =1073741824 bytes
tb	1 tb = 2 ⁴⁰ =1099511627776 bytes
eb	1 eb = 2 ⁵⁰ =1125899906842624 bytes
hex	A hexadecimal number
sec (sector)	A number is in sectors

You may also select the multipliers in the drop-down boxes.

 Type an offset to which you want to go. You may select between bytes and sectors. See the [Data Formats and Multipliers](#) topic for more details on data formats.

If a file is opened in **Text/Hexadecimal Editor** , you may select data representation for that file.

When the multiplier has been changed, the data value will be changed according to the specific shortcut commands for that field:

Suppose, the initial value is 1 GB, and the sector size of the object is 512 byte. The results will be the following:

Command: No recalculate

Change from GB to MB: 1

Change from GB to Sectors: 1

Command: Always recalculate

Change from GB to MB: 1024

Change from GB to Sectors: 2097152

Command: Units type recalculate

Change from GB to MB: 1

Change from GB to Sectors: 2097152

5.5 Data Recovery on HFS/HFS+ File System

When deleting a file, Mac OS X deletes system BTree+ records describing the file. Therefore, it is hard to recover such file directly. Those records may remain in:

1. The swap file (if the deleted file has been deleted recently).
2. In the journal (if the HFS+ journaling is on, and the deleted file has been CREATED recently)

Actually, if a file has been deleted, chances that the records would be found are small. To greatly increase the chances to recover deleted files successfully , you may actively use scanning with enabled [Known Files Types](#).

Note: All above is correct for intentionally deleted files. In case of a corrupted file system, HFS/HFS+ can be recovered quite successfully.

When recovering files with HFS+-specific attributes (resource fork, finder info, etc.), **R-Studio** saves it in the so-called [AppleDouble](#) format. When they are copied to an HFS+ disk under Mac OS X, those attributes will be automatically restored.

5.6 Supported Virtual Disk and Disk Image Formats

Along with file formats used for purely disk backup and [imaging](#) purposes, there are file formats for virtual disks. Virtual disks are software components that emulates data storage devices in virtual machines. At the same time, virtual disks can be used for disk backup and imaging, too. That is why it's expedient for disk backup and imaging software to support various file formats for virtual disks. This is especially important for system interoperability, when it's necessary to use disk backup/image files on other machines where the disk backup and imaging software isn't installed.

Currently **R-Studio** supports the following virtual disk and disk image formats:

RDR: A proprietary disk image format developed by **R-Tools Technology, Inc (R-TT)**. It is the main format in **R-Drive Image**, **R-Studio**, **R-Linux**, and **R-Undelete**. RDR files are interchangeable, that is, any **R-TT** program may load and process, within its capabilities, any rdr file created in another **R-TT** program.

The following image formats can be created only in the **R-Studio Corporate** and **Technician/T80+** versions:

VHD/VHDX: A virtual disk file format built into Windows. It's a native virtual hard drive for Hyper-V, the Windows virtual machine. You may read more about these file formats in Wikipedia: [VHD \(file format\)](#). **R-Studio** creates a special file with some metadata for the VHD file format, its extension is vhr. The VHDX file format contains this metadata within its main file.

VMDK: A virtual disk file format for the most virtual machines like VMware Workstation, VirtualBox, Parallels Desktop for Mac, etc. You may read more about these file format in our Glossary: [What is a VMDK Virtual Disk](#).

VDI: A virtual disk file format for the VirtualBox virtual machine. **R-Studio** creates a special file with some metadata for the VDI file format, its extension is vdr. You may read more about these file format in Wikipedia: [VDI](#).

R-Studio Standalone can load these image formats.

The main features of these file formats are presented in the table below:

Features	RDR	VHD/VHDX	VMDK	VDI
Compression	Yes	No	Yes	No
Encryption	Yes	No	No	No
Image Split	Yes	No	Yes	No
Native mounting on Windows	No	Yes	No	No
Mounting on Windows using R-Studio	Yes	Yes	Yes	Yes

Additional file formats that can be opened "read-only"

Extensions	Description	Licenses
dmg	Apple Disk Image	All
e01/ewf	Expert Witness File Format	Technician/T80+

aff	Advanced Forensic Format	Technician/T80+
-----	--	-----------------

5.7 Bad Sectors

Quite often, drives from which the data are to be recovered have [bad sectors](#), or those sectors that are very hard, even impossible, to read, mostly due to hardware problems. **R-Studio** tries to read such sectors several times. The number of tries is specified either on the [Settings/Bad Sectors](#) dialog box, or on the [Properties](#) tab, the Drive Control section, for each drive separately.

When **R-Studio** encounters such bad sectors while performing various tasks and they appear unreadable, it treats them as follows:

Object images:

R-Studio fills the space in the [image](#) file where the bad sectors should be with the pattern specified in the Pattern to fill bad blocks field on the [Settings/Bad Sectors](#) dialog box. Please note that **R-Studio** writes the pattern on the image, not on the source drive.

Files

If Skip files with bad sectors on the [Recovery](#) dialog box is cleared, **R-Studio** fills bad sectors in the recovered file with the pattern specified on the the [Settings/Bad Sectors](#) dialog box. Information about such files will appear in the [Log](#).

If Skip files with bad sectors on the [Recovery](#) dialog box is selected, **R-Studio** skips files with bad sectors and displays their list on the Files with bad sectors dialog box when the recovery has been completed. You may select files to immediately recover them or to mark for later recovery. You may also save this list to a text file.

Files with bad sectors dialog box

Files with bad sectors Buttons

Select All	Click this button to select all files in the list.
Clear All	Click this button to unselect all selected files.
Mark	Click this button to mark all selected files in the list.
Save to File	Click this button to save the list of files with bad sectors to a text file.
Recover	Click this button to immediately recover selected files. The bad sectors in the recovered files will be filled with the pattern specified in the Pattern to fill bad blocks field on the Settings/Bad Sectors dialog box.

Objects edited in the Text/Hexadecimal Editor/Viewer

Bad sectors in the objects viewed/edited in the [Text/Hexadecimal Editor](#) are shown as filled with the pattern specified in the Pattern to fill bad blocks field on the [Settings/Bad Sectors](#) dialog box.

5.8 Memory Usage

You may see how much memory **R-Studio** uses while performing a data recovery task. This is especially useful when scanning large drives on a computer with limited resources. You may specify memory control options on the Memory usage tab in the **R-Studio Settings**.

To view memory usage,

1 Select Memory usage on the Tools menu

> **R-Studio** will show the total memory in your computer and how much memory it uses

Memory usage dialog box

Memory usage

Process Memory	Shows how much memory R-Studio uses. Limit shows how much memory your system can virtually allocate to R-Studio . Actual memory allocation depends also on the RAM and swap file sizes.
System Memory Physical	Shows how much RAM is in your system
System Memory Swap	Shows how much virtual memory is in your system

5.9 R-Studio Switches

If there are problems in starting **R-Studio** and while working with it, you may use switches to avoid them.

The following switches are available:

-all_drives	Forces R-Studio to show all logical disks in the system. Normally R-Studio shows only local drives in the system. Some storage devices may pretend that they are not local drives.
-debug	Includes additional debug information. When this switch is used, an additional command Create FS Snapshot on the shortcut menu appears for an object with a file system. An FS Snapshot contains system data for the file system only (file descriptions without file contents). If a problem appears, this snapshot can be sent to R-Studio technical support to identify the problem. This switch greatly slows R-Studio . You may also turn this mode on by selecting Debug Mode on the Settings dialog box.
-flush	Flushes the log file after each write to log operations. This switch is helpful when R-Studio locks and its log file remains in memory cache unwritten to a drive. This switch greatly slows R-Studio .
-log <filename>	Started with this switch, R-Studio writes its log into the specified file. If R-Studio locks and its log file remains in memory cache unwritten to a drive, use the <code>-flush</code> switch.
-mem <size in MB>	Sets memory usage limit in MB for R-Studio to reconstruct the file tree. When it exceeds the limit, a Too many files... message appears. You may temporarily stop file

	listing and browse through found files. Then you can resume file listing. You also may skip this file section and continue file listing. Example: <code>-mem 400</code> - sets the limit to 400 MB.
<code>-no_ide_ext</code>	Turns off the inquiry about extended information on HDDs in Wind9x/ME. This switch may be helpful if R-Studio returns information about HDDs incorrectly (detects HDD geometry incorrectly).
<code>-no_int13</code>	Turns off the disc access through Int13 in Wind9x/ME. This switch may be helpful if the system operates incorrectly (detects HDD geometry incorrectly or lock the system).
<code>-no_ios</code>	Turns off the Wind9x/ME protected-mode I/O system. This switch may be helpful if this system operates incorrectly (detects HDD geometry incorrectly or lock the system).
<code>-reset</code>	R-Studio resets an HDD controller each time it reads a bad sector . This switch may be helpful if the controller locks after it attempts to read a bad sector, or returns incorrect data.
<code>-safe</code>	Disables automatic partition search on a drive, file system recognition on partitions, and other potentially problematic operations. In this mode, it is necessary to use Find partition command from the drive shortcut menu to manually find a partition.

If an unrecognized problem appears, start **R-Studio** with the `-debug` and `-log <filename>` switches, and send the log and screenshot of the **R-Studio** main panel to the **R-Studio** technical support:

[R-Studio Technical Support Team](#) is available 24 hours a day, seven days a week, and has an average response time less than 4 hours.

5.10 Properties Tab

Object size units

You may select the units in which the information on object sizes will be displayed. Some parameters can be edited when the Debug mode is turned on on the [Main](#) dialog box of the **R-Studio** settings.

To select the units

- 1 Select Properties on the View menu
- 2 Select the units in which you want to see object sizes.

You may select

Show as Bytes

Show as Sectors

Show as Bytes and Sectors

1.Basic information

This section shows basic information for a drive object.

More information...

Drive Type	Device/drive type and subtype. Current R-Studio version supports the following types: Disk, WORM, CDROM, Optical, Changer, Floppy, RAM Disk, LDM Partition, LDM Component, LDM Volume and subtypes:
------------	--

	Device, OS File, Physical Drive, Mount Point, Partition, Volume Set, Mirror, Stripe Set, RAID 4, RAID 5, RAID 6
Name	Device/drive name
Size	Device/drive size
Bus Type	Device/drive bus type. Can be: IDE/ATA, IDE/ATAPI, SCSI, Floppy, USB, 1394, SSA, FibreChannel, RAID, SMART, ABIOS

2.Information on drives and logical disks

This section shows available information on drives and [logical disks](#). These properties depend on the drive/disk type and appear only when applicable. Under Windows, an IDE drive/disk may be represented as a SCSI device, that is why the SCSI Address section appears under these OSES for those drives/disks.

▣ More information...

OS object	Appears for image files under Windows for drives/disks. An object name used by OS to access the Device/drive.
R-Studio driver	Driver names (both internal and OS) used to access this drive/disk.
Sector Size	Drive/disk sector size
Physical Drive Geometry	This section shows physical geometry for a drive. For a logical disk it shows the physical geometry for a drive where the logical disk resides
Cylinders	
Tracks Per Cylinder	
Sectors Per Track	
Sector Size	
Device Identification	This section shows vendor information for the drive/disk
Vendor	
Product	
Firmware	
Bus	
SCSI Address	This section shows SCSI information for the drive/disk
Port Number	
Path ID	
Target ID	
Lun	
Windows 9x/ME adds the following properties:	
Int13 Drive Number	128 for the first drive accessible through Int13, 129 for the second one, etc. 0...128 for drives and other devices accessible through a Windows 9x/ME protected mode driver, if their Int13 device option is disabled. R-Studio can use Int13 disk access, and for some drive types, like SCSI devices, Int13 access is preferable. You may consider enabling the Int13 device option in the Windows Device Manager for such devices.
Int13 Extension Version	Int13 Extension Version Support for drives. Extended Int13 support is necessary for large drives. If this property is zero, Extended Int13 is not supported, otherwise, it

	shows Extended Int13 standard version, the larger, the better.
--	--

3.Properties controlling access to drives and logical disks

This section shows properties that control access (read and write) to drives and logical disks. They are set to their optimal values and should be altered only if access problems appear.

More information...

Drive Control	
Maximum transfer	Maximum data size that can be read or written during a single access to the drive. If there are problems with drive access, decrease the value of this property
I/O Unit	Data size read or written during a single access to the drive is a multiple value of this property. If there are problems with drive access, decrease the value of this property
Buffer Alignment	Drive data transfer buffer is positioned at an address multiple value of this property. If there are problems with drive access, increase the value of this property.
These three properties are set by OS drivers. If the drivers set incorrect values, problems may appear during data transfer operations. You can alter them until data transfer becomes stable.	
I/O Tries	<p>Number of read/write tries during access to the drive. If there are bad sectors on the drive, increase the value of this property. This may help to successfully read those sectors. Sometimes, if the I/O Tries parameter is set too large and there are some unreadable sectors on the drive, the drive-controller pair may refuse to perform any successive read/write operations with the entire drive when it fails to read/write such sectors. In this case, set this parameter to zero.</p> <p>The default value is specified in the Settings (Bad Sectors) panel.</p> <p>R-Studio treats bad sectors in the following way: It reads a certain part of drive (predefined by Windows) and</p> <ul style="list-style-type: none"> • If Default read attempts is set to 0, the entire part with bad sectors will be filled with the specified pattern. • If Default read attempts is set to a non-zero value, R-Studio reads again that part sector by sector, repeating the attempts the specified number of times. If R-Studio still cannot read a bad sector, it fills the sectors with the specified pattern. In this case only the bad sectors will be filled with the pattern, but that extremely slows the drive read process. <p>For example, if you set Default read attempts to 1, a bad sector will be read 2 times.</p>

4.Partition properties

A [partition](#) is a continuous area on a drive, characterized by its offset and size. There are partitions on basic disks, dynamic disks, and recognized volumes and partitions. **R-Studio** treats regions like partitions.

More information...

Partition Offset	Initial offset for the partition.
Partition Size	Size of the partition.
Partition Type	File system type for the partition. If the record in the drive partition table is incorrect, this property may differ from the actual file system type for this partition. Still, R-Studio will process this partition correctly, as it does not use this property.
Partition number	Appears under Windows NT/2000/XP/2003/Vista/2008/7/8/8.1/10 only. Shows the number of the partition on the physical drive.

For regions and recognized partitions, Partition Offset and Partition Type properties can be manually corrected.

5. Compound volume properties

A *compound volume* is a union of several partitions or other drive objects. Each union type has its own rules, unique for each compound volume type. Among compound volumes are: *Volume Sets* (RAIDs Level 0), *Mirrors* (RAIDs Level 1), *RAIDs4/5/6* (RAIDs Level 4/5/6), both physical and created by the user (*Virtual Volume Sets*, *Virtual Stripe Sets*, *Virtual Mirrors*, *Virtual RAID5*).

More information...

Main properties of compound volumes are *parents* (drive objects from which a compound volume is created) and their order. These properties may be viewed in the Parents tab. For user-created compound volumes these properties may be altered.

Raid Block Size	Data block size for compound volumes of RAID (Level 0-5) types
-----------------	--

6. LDM disks and volumes (Dynamic Disks)

LDM disks and volumes are volumes controlled by Logical Disk Manager (LDM). They are represented on a drive as a LDM database rather than partition tables. Under Windows 2000/XP/2003/Vista/2008/7/8/8.1/10, LDM disks are also called *Dynamic Disks*.

More information...

Offset of Logical Disk	Initial offset of a logical disk on a drive. For disks, initially formatted by LDM, this value is often 31.5KB , for converted disks, it may be larger.
Supposed Parents Count	Supposed number of parent partitions for compound LDM volumes. If the LDM database is not damaged, the value of this property must be equal to the number of parent objects in the Parents tab for the drive object.
LDM Host GUID	Global Unique Identifier of a computer system where this LDM disk group has been created.
LDM DiskGroup GUID	Global Unique Identifier of the LDM disk group.
LDM Disk GUID	Global Unique Identifier of the drive.
LDM Volume GUID	Global Unique Identifier of the volume.
LDM Disk ID	Local drive Identifier, unique within this LDM disk group.
LDM Partition ID	Local partition Identifier, unique within this LDM disk group.
LDM Component ID	Local component Identifier, unique within this LDM disk group.
LDM Volume ID	Local volume Identifier, unique within this LDM disk group.
LDM Disk AltName	Additional Alternative Name given by LDM to the drive.
LDM Disk DriveHint	Last name of the volume, under which it has been mounted in the system. May be either a letter (C:, D:, etc.), or a mount point under Windows 2000/XP/2003/Vista/?/2008/7/8/8.1/10.

7. File System Volume properties

A *File System (FS) volume* is a disk object where a certain, supported by **R-Studio**, file system is present. There are two FS volume types: FS volume on a regular drive object and a recognized volume, found by a scan process. FS volume properties depend on volume's file system and type.

7.1.NTFS Volume properties

These properties are present for all NTFS volumes and represent their main properties. For *recognized volumes*, these values can be altered.

▣ **More information...**

NTFS Information	Regular volumes
Recognized NTFS	Recognized volumes
Cluster Size	Cluster size for the NTFS volume.
MFT record size	Size of one MFT record describing one file on the NTFS volume. This is an important property of any NTFS volume. Its common value is 1KB. If this property has incorrect value, many files may be incorrectly recovered.
Sector Size	Sector size for the physical drive. This property is read from the boot sector of the NTFS volume and does not affect R-Studio operation.
Index Block Size	Index block size for the NTFS volume. This property determines binary trees used to store NTFS folder structure. It does not affect R-Studio operation.
MFT position	MFT offset from the start of the NTFS volume.
MFT Mirror Position	Second MFT copy offset from the start of the NTFS volume.
Volume size	Size of the NTFS volume. This property does not affect R-Studio operation.

7.2.FAT Volume properties

These properties are present for all [FAT](#) volumes and represent their main properties. For *recognized volumes*, these values can be altered.

▣ **More information...**

FAT Information	Regular volumes
Recognized FAT	Recognized volumes
FAT Bits (12,16,32)	FAT type. 12 for the FAT12, 16 for the FAT16, 32 for the FAT32.
Cluster Size	Cluster size for the FAT volume.
First Cluster Offset	Offset of the first cluster from the start of the FAT volume.
Boot Directory Cluster	(<i>For FAT32 only.</i>) Cluster number where the root directory starts on the FAT volume where the logical disk resides.
Root Directory Offset	(<i>For FAT12 and 16 only.</i>) Root directory offset from the start of the FAT volume.
Root Directory Length	(<i>For FAT12 and 16 only.</i>) Root directory length for the FAT volume.
First FAT Offset	Offset for the first FAT table on the volume. Together with the Size of One Fat Table property, is a most important property for a FAT volume. If this property is incorrect, many files (especially fragmented ones) may be incorrectly recovered.
Size of One FAT Table	Size of one FAT table on the volume.
Sector Size	Sector size of the drive. This property is read from the boot sector of the FAT volume and does not affect R-Studio operation.
Number of FAT Copies	Number of FAT copies on the FAT volume.

Active FAT copy	Active FAT table number for the FAT volume. Can be set to Disabled, Auto, 1, or 2. If it is Disabled, R-Studio processes the volume as there is no FAT table present. This may be useful if the volume has been reformatted and thus a new FAT table is created and the old one is deleted. In this case, it is reasonable to recover files from the previous volume without processing the new and irrelevant FAT table. All files will be recovered as continuous byte chains beginning from their start cluster. Unfragmented files will be recovered successfully. If it is 1 or 2, R-Studio uses the first or second FAT table copy, respectively. If it is Auto, R-Studio uses both FAT table copies and decides, which FAT table copy should be used for a particular FAT table sector. This may be useful when both FAT tables are partially damaged.
Major version	FAT version.
Minor version	FAT minor version.
Volume size	Size of the volume.

7.3. Ext2/3/4FS Volume properties

These properties are present for all [Ext2/3/4FS](#) volumes and represent their main properties. For *recognized volumes*, these values can be altered.

More information...

Ext2FS Information	Regular volumes
Recognized Ext2/3/4FS	Recognized volumes
Block Size	Block size of Ext2FS file system. A block in the Ext2/3/4FS file system is similar to a cluster in the FAT file system.
First SuperBlock Offset	Offset of the first SuperBlock from the start of the Ext2/3/4FS volume.
Blocks Per Volume	Number of blocks in the Ext2/3/4FS volume.
INodes Per Volume	Number of inodes on the Ext2/3/4FS volume. An inode is a record describing file's size, attributes, position on an Ext2F/3/4S volume - all information about a file, except its name, which is stored separately. Therefore, the INodes Per Volume parameter is equal to the maximum number of files on an Ext2/3/4FS volume.
Creator OS	The OS that created this Ext2/3/4FS volume. May be Linux, Hurd, Masix, FreeBSD, Lites.
Major version	Ext2/3/4FS version. Usually 1.
Minor version	Ext2/3/4FS minor version. Usually 0.
Last Mount Time	Last mount time for this Ext2/3/4FS volume.
Last Write Time	Last write time for this Ext2/3/4FS volume.
Last Check Time	Last check time for this Ext2/3/4FS volume.
Volume size	Size of the volume.

7.4. Recognized Volume properties

These properties are present for all *recognized volumes*, regardless of their file system type. They estimate how reliable those volumes are recognized. This is useful for fast search for, and selection of, optimally recognized volume to recover.

 **More information...**

<p>Parsed File Entries</p>	<p>Number of files proving that this recognized volume existed. May have any non-negative values. The main property characterizing the reliability of volume recognition. The larger it, the higher probability that this recognized volume has file system properties that have been correctly found.</p>
<p>Parsed Boot Records</p>	<p>Number of boot records proving that this recognized volume existed. May be 0 or 1. This is the second important property characterizing the reliability of volume recognition.</p>
<p>Estimated Size</p>	<p>Estimated size of the recognized FS partition/volume. This property shows the most probable size of the recognized FS partition/volume. Alternatively, Size and Partition Size are set to the highest possible values in order to recover the maximum number of files.</p>

VI R-Studio Emergency

R-Studio Emergency is a tool that allows you to startup a computer with a damaged startup disk and recover data stored on its hard drives. Then restored data can either be saved on its disk or transferred to a working computer via a network.

The R-Studio Emergency version is a part of the R-Studio software package.

You may run this R-Studio Emergency version on a computer for which you have bought an R-Studio license, and you may not transfer the licensed software to another computer.

6.1 Contact Informaiton and Technical Support

To obtain the latest version of **R-Studio Emergency**, go to:

Product Site: <http://www.r-tt.com>

Sales Department: sales@r-tt.com

R-Studio Technical Support Team is available 24 hours a day, seven days a week, and has an average response time less than 4 hours.

Tech. Support: support@r-tt.com

Send your support request to: http://www.r-tt.com/Support_request.html

6.2 Creating Startup Disks

- [Installing R-Studio Emergency Startup Media Creator](#)
- [Creating Startup Disks Using R-Studio Emergency Startup Media Creator](#)

- [Creating Startup Disks for Mac and Linux Computers](#)

6.2.1 Installing R-Studio Emergency Startup Media Creator

You must have administrative privileges to install R-Studio Emergency Startup Media Creator.

If you are not sure whether you have such privileges, you almost certainly do not have them. Contact your system administrator for assistance.

1 Run the setup wizard

2 Read the License Agreement and accept its conditions.

3 Select the installation location

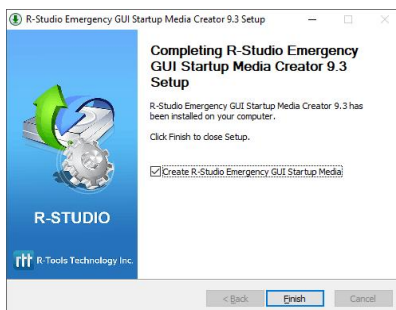

4 Select the Start Menu Folder

5 Wait for the program to install

6 You may start creating R-Studio Emergency immediately upon install completion.

6.2.2 Creating Startup Disks Using R-Studio Emergency Startup Media Creator

You need to create either

- A startup FAT/FAT32 removable device recognized by your system as a bootable one. The total available size of the device should be more than 50 MB. You may use this device to start both UEFI computers (modern Windows/Mac/Linux systems) and old Windows/Mac/Linux machines.

or

- A startup CD/DVD disc. You may create an ISO image, or write the disc directly from **R-Studio** Emergency Startup Media Creator, if there is a CD/DVD recorder in your system. You may use this disc to start both UEFI computers (modern Windows/Mac/Linux systems) and old Windows/Mac/Linux machines.

You may create a [Linux-based](#) or [WinPE](#) based startup disk.

1 Run R-Studio Emergency

Welcome dialog box

click the **Next** button to see the list of all devices on which startup disks may be created.

Startup media type selection dialog box

A Linux-based disk

Check the [Hardware Compatibility List](#).

If you have problems with starting your computer up from the **R-Studio** Emergency startup disks, select **Configure startup media troubleshooting options** on the Startup media type selection dialog box. Then the [Startup Media Troubleshooting Options](#) dialog box will appear. You may configure these options to eliminate those problems.

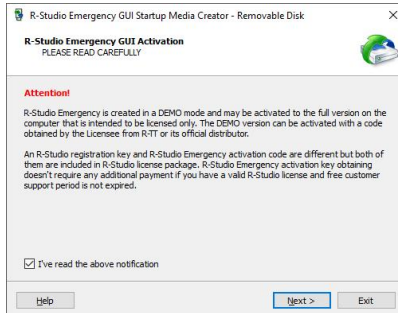

3 Select Linux based on the Startup OS selection and click the Next button.

Startup OS selection dialog box

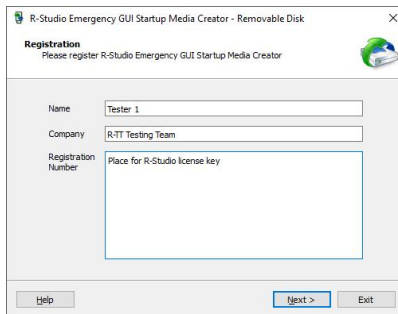

- 4 Read and accept the Activation terms on the R-Studio Emergency GUI Activation dialog box and click the Next button.

R-Studio Emergency GUI Activation dialog box

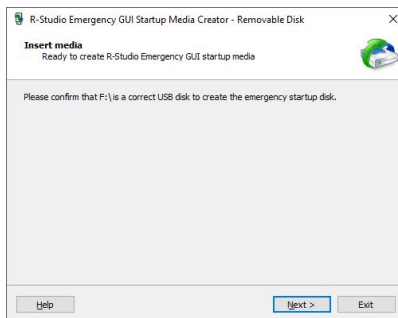

If you create startup disk for **R-Studio Emergency Technician**, you'll need to enter your license key on the Registration dialog box.

Registration dialog box

- 5 Specify the path and name for the ISO file or verify that you've select the correct USB device and click the Next button.

Insert media dialog box

- > **R-Studio Emergency Startup Media Creator will start creating the startup USB disk showing the progress on the Creating startup media dialog box**

Creating startup media **dialog box**

R-Studio Emergency Startup Media Creation is Finished message

Startup Media Troubleshooting Options

Those options will help you if you have problems with starting you computer up from the **R-Studio** startup disks. Please, contact the [R-Studio Technical Support Team](#) for more information.

R-Studio Startup Media Troubleshooting Options **dialog box**

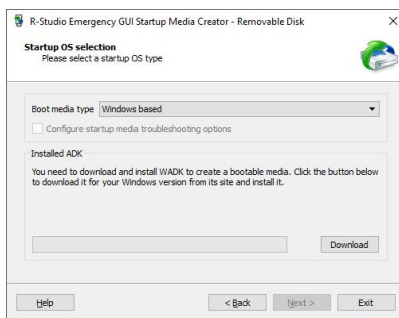

Display kernel startup messages	if this checkbox is enabled, R-Studio Emergency displays all startup messages. That may be useful to locate the source of the problem when your system hangs during R-Studio Emergency startup.
Disables ACPI Disables APIC	Select these checkboxes when your system detects some hardware incorrectly during R-Studio Emergency startup and displays messages like: hda: lost interrupt
Disables USB device support	Select this checkbox if your system experiences problems with USB devices during R-Studio Emergency startup.

Disables SCSI device support	Select this checkbox if your system experiences problems with SCSI devices during R-Studio Emergency startup.
Disables PCMCIA device support	Select this checkbox if your system experiences problems with PCMCIA devices during R-Studio Emergency startup.
Disables DMA for all IDE disk drives	Select this checkbox if your system experiences problems with IDE disks during R-Studio Emergency startup.
IRQ polling mode	Select this checkbox to enable the IRQ polling mode to prevent locking the system because a device generates too much interrupts for the system to handle.
PCI BIOS	Select an appropriate option if your system experiences problems with PCI cards.
BIOS RAIDS	Select an appropriate option if your system experiences problems with RAIDs built in the system board.

A WindowsPE-based disk

3 Select Windows based on the Startup OS selection and click the Next button.

Startup OS selection **dialog box**

If you select this option for the first time, you'll need to download and install some extra Windows components. Click the Download button and follow the on-screen instructions. When the process is finished, you'll be able to continue creating the startup disk.

Startup OS selection **dialog box**

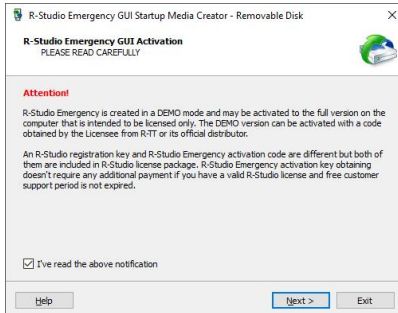

If you select this option for the first time, you'll need to download and install some extra Windows components. Click the Download button and follow the on-screen instructions.

You don't have to perform these steps next times.

- 4 **Read and accept the Activation terms on the R-Studio Emergency GUI Activation dialog box and click the Next button.**

R-Studio Emergency GUI Activation dialog box

If you create startup disk for **R-Studio Emergency Technician**, you'll need to enter your license key on the Registration dialog box.

Registration dialog box

- 5 **Specify the path and name for the ISO file or verify that you've select the correct USB device and click the Next button.**

Insert media dialog box

- > **R-Studio Emergency Startup Media Creator will start creating the startup USB disk showing the progress on the Creating startup media dialog box**

Creating startup media **dialog box**

R-Studio Emergency Startup Media Creation is Finished message

6.2.3 Creating Startup Disks on Mac and Linux Computers

To start a Mac or a Linux computer, you may use the following devices:

1. A USB device created using the R-Studio Emergency Startup Media Creator for Windows. See the [Creating Startup Disks Using R-Studio Emergency Startup Media Creator](#) page for more details.
2. A USB device created using a Mac or Linux computer. To create such device, download the ZIP archive of R-Studio Emergency, unzip it, and write files to a FAT32-formatted USB device.

Please note that you cannot use this disk to start non-UEFI computers (old Macs, for example), nor can you just copy those files to a CD/DVD disc to create an R-Studio Emergency startup disc. If you need a CD/DVD disc, burn it using the ISO image.

3. A startup CD/DVD disc. Download the ISO image of that disk and burn it or use the R-Studio Emergency Startup Media Creator for Windows to burn it on a Windows computer.

6.3 R-Studio Emergency Operation

[Creating Startup Disks](#)

6.3.1 Starting a Computer with the R-Studio Emergency Startup Disks

We recommended that you print out this help page and have the hardcopy on hand while you are performing this action.

If there is a non-IDE disk controller in your system, or you plan to use network disks or external hardware devices, first check the [Hardware Compatibility List](#).

If you plan to use any external device, turn it on before starting the system.

If the motherboard in your computer supports the Serial ATA (SATA) devices, but IDE disks are also present, only the SATA devices should be set to the Enhanced Mode in BIOS.

To start the computer with the R-Studio Emergency startup CD/DVD disc or any removable device,

- 1 Make sure that the first startup device in the system BIOS is the CD/DVD drive or the removable device**
Disable "Secure boot" in the system BIOS if your computer is certified to run Windows 8. Refer to your system documentation for details.
- 2 Insert the R-Studio Emergency startup CD/DVD disc and start your computer**

☐ If you have a Mac computer

To start a Mac computer with the **R-Studio Emergency** startup disk,

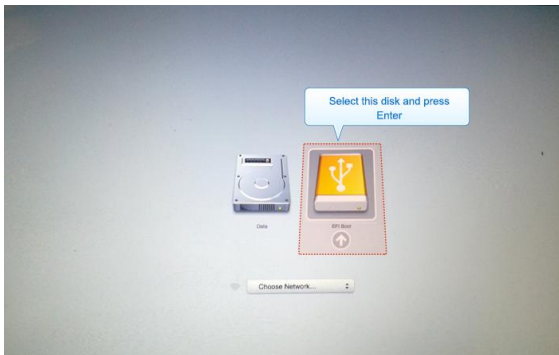

1. Insert a CD/DVD disc or connect a USB disk
2. Switch the Mac on.
3. While loading, press the **Option** key on the Mac keyboard (the **Alt** key if you use a non-Apple keyboard).

The Options key

4. Select the **EFI boot disk** and press **Enter**.

The R-Studio Emergency startup disk

R-Studio Emergency will start loading.

Then a startup screen will appear:

Select the **R-Studio Emergency GUI (Graphic Mode)** to run **R-Studio Emergency** in the graphic mode in which its user interface is similar to the Windows version. If **R-Studio Emergency** cannot run in this mode, restart the system in the Safe VGA mode (only VESA-compliant) which is compatible with most video cards and monitors. If it fails too, select the Text mode in which the **R-Studio Emergency** user interface is shown in the pseudo-graphic mode compatible with all video cards. The help describes this pseudo-graphic mode.

> **R-Studio Emergency** will start and its Device/Disk panel will appear

To start the computer with the **R-Studio Emergency** startup floppy disks,

1 Make sure that the first startup device in the system BIOS is A (Floppy)

Refer to your system documentation for details.

2 Insert the first startup floppy disk and start your computer

> The following text will appear on the screen:

```
Loading
Uncompressing ... OK, starting the kernel
VFS: Insert the second boot disk and press ENTER
```

3 Insert the second disk and press ENTER.

> R-Studio Emergency will start and its Device/Disk panel will appear

Secure boot:

It may be impossible to start a Windows 8 certified computer with the R-Studio Emergency startup disk without some additional actions. This happens because any computer should use a so-called "Secure boot" procedure to comply with Windows 8 hardware certification from Microsoft. In brief, this procedure prevents computer from booting into any operating system that isn't digitally signed with an appropriate digital signature. "Secure boot" is claimed to prevent unauthorized modification of the boot sector by bootkits, viruses, trojans, and other malicious software. To the date, only Windows 8, Windows Server 2012, and selected Linux distributions support this feature. As a side effect, it also prevents most LiveCDs, rescue disks (R-Studio and R-Drive Image included), and other OS from running.

Likely enough, the other requirement of Windows 8 hardware certification is to make it possible for the user to disable the Secure boot procedure. Those settings can be done through the system BIOS under the Boot options. Generally, it's enough to enable Legacy support in those options, but sometimes it may require additional actions. Please, refer to your system documentation to learn more about disabling/enabling Secure boot.

When Secure boot is disabled, it should be possible to start the computer with the R-Studio Emergency startup disk.

Please note that you should enable this feature back after using the startup disks because Windows 8 or Server 2012 may not start properly without the Secure boot feature enabled.

6.3.2 File Recovery

To recover files,

1 Select a partition on the Device/Disk panel on which the files to recover reside and press the Enter key

> R-Studio will change its panel showing the disk's folders/files structure

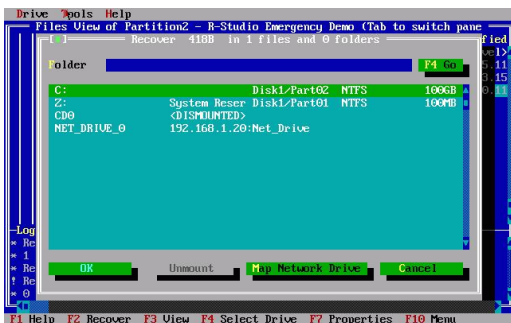

2 Select the file to recover on the Files View panel. Use the Tab key to switch between panes

Files View panel

- 3 Press the F2 key and specify the output folder on the Recover dialog box

Recover dialog box

External USB drives with the NTFS file system: R-Studio Emergency can save recovered files on such disks if they are properly disconnected in a Windows system using the **Safely Remove Hardware** icon in the system tray or while shutting Windows down.

[Searching for a File](#)[Mapping Network Drives](#)[Viewing object properties](#)

6.3.3 Searching for a File

To search for a file,

- 1 Select Find on the Tools menu (or press the Alt+F key)
- 2 Specify a file name or mask

Find dialog box

Look at dialog box

Deleted files:	If it is selected, R-Studio makes a search among deleted files/folders.
----------------	--

Existing files:	If it is selected, R-Studio makes a search among existing files/folders.
Files:	If it is selected, R-Studio includes files into a search.
Folders:	If it is selected, R-Studio includes folders into a search.

To find the next file corresponding to the specified file mask,

- * Press the Alt+N key

6.3.4 Disk Scan

To scan an object

- 1 Select an object on the Device/Disk panel and press the F6 key
- 2 Specify the required parameters on the Scan dialog box and press the Enter key

Scan dialog box

Scan dialog box

Start:	Sets the start point of the area to be scanned.
Size:	Sets the size of the area to be scanned.
Numbers in these fields can be in bytes or sectors. If no letters are after the numbers, R-Studio assumes the numbers in bytes. The following case-ignoring notation is possible:	
b	Bytes
kb	Kilobytes
mb	Megabytes
gb	Gigabytes
tb	Terabytes

- > When an object is scanned, it may be searched for files, and found files may be recovered the same way as for a regular object

Scan results

Found objects:

Extra Found Files	Entries of known file types have been found
Recognized1	Records and file entries are found for this partition
Recognized2	Only file entries are found for this partition
Recognized3	Only boot records are found for this partition

To save scan information

- 1 Select an object with scan information
- 2 Press the Alt+D key and select Save Scan Information on the Drive menu
- 3 Specify the output folder and file name on the Save Scan Information dialog box

[Mapping Network Drives](#)

To open scan information

- 1 Select an object to which scan information is to be opened
- 2 Press the Alt+D key and select Open Scan Information on the Drive menu
- 3 Specify the folder and file name with the scan information on the Open Scan Information dialog box

[Mapping Network Drives](#)

To delete scan information

- 1 Select an object to which scan information is to be deleted
- 2 Press the Alt+D key and select Delete Scan Information on the Drive menu

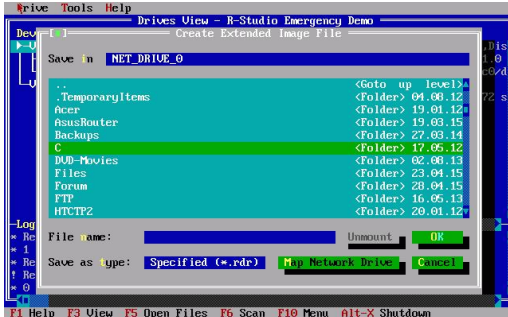

6.3.5 Disk Images

To create an image file

- 1 Select an object on the Device/Disk panel

- 2 Press the **Alt+D** key and select **Create Plain Image File** or **Create Compressed Image File** on the **Drive** menu

Create Image **dialog box**

Plain Image

If this option is selected, **R-Studio** will create a simple exact copy of the object. This image format is compatible with the previous versions of **R-Studio**.

Compressed Image

If this option is selected, **R-Studio** will create an image file compatible with the images created by **R-Drive Image**, but incompatible with the previous versions of **R-Studio**.

- 3 Specify the output folder and file name on the **Create Image File dialog box**

[Mapping Network Drives](#)

To load an image file

- 1 Press the **Alt+D** key and select **Open Image File** on the **Drive** menu
- 2 Specify the folder and file name with the image on the **Open Image File dialog box**

[Mapping Network Drives](#)

6.4 Using R-Studio Emergency as an Emergency Agent

R-Studio Emergency Linux version can be used as an emergency agent for **R-Studio**. Moreover, if you have a Mac computer, this is the only way to start it with **R-Studio Agent Emergency**.

To start the computer with the **R-Studio Emergency/Agent startup CD/DVD disc or any removable device**,

- 1 **Make sure that the first startup device in the system BIOS is the CD/DVD drive or the removable device**
Disable "Secure boot" in the system BIOS if your computer is certified to run Windows 8. Refer to your system documentation for details.
- 2 **Insert the R-Studio Emergency startup CD/DVD disc or the removable device and start your computer**

If you have a Mac computer

To start a Mac computer with the **R-Studio Emergency** startup disk,

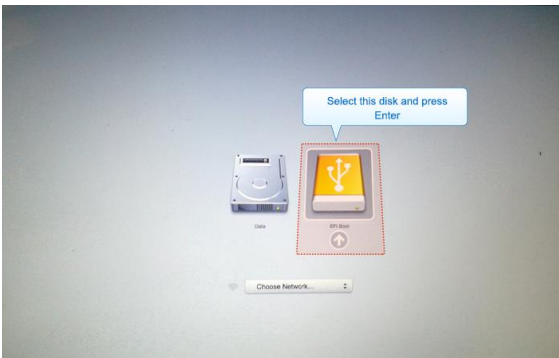

1. Insert a CD/DVD disc or connect a USB disk
2. Switch the Mac on.
3. While loading, press the **Option** key on the Mac keyboard (the **Alt** key if you use a non-Apple keyboard).

The Options key

4. Select the **EFI boot disk** and press **Enter**.

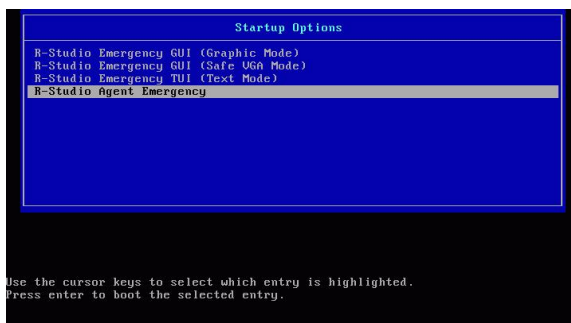

The R-Studio Emergency startup disk

R-Studio Emergency will start loading.

Then a startup screen will appear:

Startup Options

- 2 Select the **R-Studio Agent Emergency** to run **R-Studio Emergency** as an emergency agent.
- > **R-Studio Agent Emergency** will start and its prompt will appear

R-Studio Emergency as an Emergency Agent

```

Loading rootagt...ok

? R-Studio Agent Emergency is not yet registered, 256KB file size recovery limit
  is implied until remotely registered
* R-Studio Agent Emergency started and ready to accept connections...
* R-Studio Agent Emergency is listening on IP(s): 192.168.1.14
* You may press 'E' to view EULA, press 'L' to view Third-Party Copyright Notice
  s and Disclaimers, press ENTER to start connection to remote R-Studio ...

```

If your network has a DHCP server

The computer running R-Studio Agent Emergency will be assigned an IP address automatically

A prompt with a computer address will appear. You need to remember it to access the computer via network.

If your network does not have a DHCP server

You need to configure the interfaces and IP addresses manually.

1. Press Enter to start configuring the settings. A prompt to select an interface will appear. Enter the selected interface name and press **Enter**.
2. A prompt to enter its IP address and optional subnet mask will appear. Enter the IP address and optional subnet mask and press **Enter**.

Network Setting Configuration

```

# and Disclaimers, press ENTER to start connection to remote R-Studio ...
```

Now the computer may be accessed by **R-Studio** via network.

Secure boot:

It may be impossible to start a Windows 8 certified computer with the R-Studio Emergency startup disk without some additional actions. This happens because any computer should use a so-called "Secure boot" procedure to comply with Windows 8 hardware certification from Microsoft. In brief, this procedure prevents computer from booting into any operating system that isn't digitally signed with an appropriate digital signature. "Secure boot" is claimed to prevent unauthorized modification of the boot sector by bootkits, viruses, trojans, and other malicious software. To the date, only Windows 8, Windows Server 2012, and selected Linux distributions support this feature. As a side effect, it also prevents most LiveCDs, rescue disks (R-Studio and R-Drive Image included), and other OS from running.

Likely enough, the other requirement of Windows 8 hardware certification is to make it possible for the user to disable the Secure boot procedure. Those settings can be done through the system BIOS under the Boot options. Generally, it's enough to enable Legacy support in those options, but sometimes it may require additional actions. Please, refer to your system documentation to learn more about disabling/enabling Secure boot.

When Secure boot is disabled, it should be possible to start the computer with the R-Studio Emergency startup disk.

Please note that you should enable this feature back after using the startup disks because Windows 8 or Server 2012 may not start properly without the Secure boot feature enabled.

To connect to R-Studio's computer,

- 1 Press the Enter key and enter the IP address of the computer where R-Studio is running as IPaddress:port.

The default port is 8080, and you don't have to specify it.

- 2 Enter the password if required, and press the Enter key.
- > When the connection is established successfully, R-Studio Agent Emergency will notify you about this.

[Using R-Studio Emergency as Emergency Agent](#)

[Hardware Compatibility List](#)

6.5.1 Properties and Text/Hexadecimal Viewer

To view object properties,

- 1 Select an object
- 2 Press the F7 key

To view an object

- 1 Select an object
- 2 Press the **F3** key
- 3 Press the **F6** key to view and select file attributes
Press the **Esc** key to close the viewer.

6.5.2 Network Drives

To map a network drive,

- 1 On a dialog box with Map Network Drive, press the **Alt+M** key
> The Querying DHCP message will appear

If the network has a DHCP server, the computer will obtain an IP address automatically. A list of adapters and their IP addresses will appear on the Network Adapters dialog box.

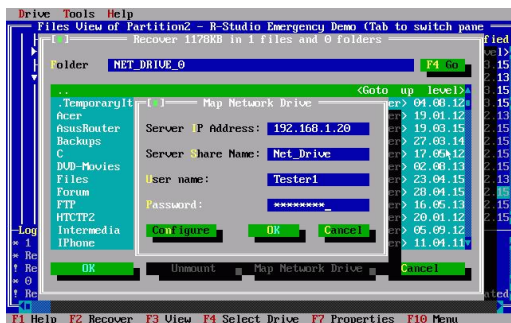

If the network does not have a DHCP server, select a network adapter on the Network Adapters dialog box and press the **F4** key. Enter the IP address and network mask and press the **Enter** button.

Network Addresses dialog box

- 2 Select a configured network adapter and press the **Enter** key
- 3 Enter the required information on the Map Network Drive message message

Map Network dialog box

Server IP Address:	IP address of the computer where the network drive is to reside.
Server Share Name:	Name of the shared folder where the network drive is to reside.
Login:	Username of a user on the computer where the network drive is to reside.
Password:	User's password on the computer where the network drive is to reside.

For the network drive's path //SERVER/Net_Drive,

Server IP address: The IP address of the `SERVER` computer (192.168.1.20)

Server share name: `Net_Drive`.

> The mounted network disk will appear

To disconnect a mounted network drive

- 1 Select a mounted network drive
- 2 Switch to the Disconnect button and press the Enter key

6.5.3 Log

To clear log information

- * Select Clear Log on the Tools menu

To save log information to a file

- * Select Save Log To File on the Tools menu

6.5.4 Devices to Store Recovered Files

R-Studio Emergency can write recovered files to the following devices:

- FAT devices such as USB sticks, memory cards, and other similar devices. Such devices are inexpensive and easily available, they can be fully accessed by all operating systems, but they have one important drawback: they cannot store files larger than 2GB. So, if you plan to recover large video files, this is not your option.
- exFAT devices such as large USB sticks and memory cards, external hard disks, and other similar devices. They are fully accessed by all operating systems. Unlike FAT devices, they don't have the 2GB file size limit.
- NTFS disks (primarily used in Windows computers).
Access without any third-party software:
Windows computers: full.
Mac computers: read.
Linux computers: full.
- HFS/HFS+ disks (used in Mac computers).
Access without any third-party software:
Windows computers: no.
Mac computers: full. Some access problems may appear for files written by **R-Studio Emergency**.
Linux computers: full. Some access problems may appear for files written by **R-Studio Emergency**.
- Ext2/3/4 disks (used in Linux computers).
Access without any third-party software:
Windows computers: no.
Mac computers: no
Linux computers: full.

- XFS disks (used in Linux computers).

Access without any third-party software:

Windows computers: no.

Mac computers: no

Linux computers: full.

- Network disks. Such disks may be on other network computers or NAS devices. See the [Network Drives](#) page for more details

How to solve file access problems on Macs

Finder in the OSX system shows such inaccessible folders and files in the following way:

Inaccessible folders in Finder

To get access to such data, do the following:

1. Under an administrator account, right-click the folder and select **Get Info** on the contextual menu.

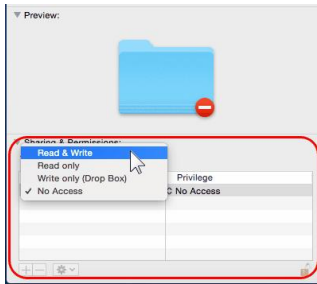

Info of an inaccessible folder

Click the **Lock** icon in the **Sharing & Permissions** section to unlock the folder properties. The system will ask you for the account password.

2. Click the **Privilege** column and select **Read & Write** on the contextual menu.

Setting the access rights for the folder

3. If this is a folder with other folders and files, click the **Properties** icon and select **Apply to enclosed items**.

Setting access rights for enclosed items in the folder

Then click the **Lock** icon to lock the properties back.

6.6 R-Studio Emergency Hardware Compatibility List

R-Studio Emergency supports the following hardware devices:

Data Storage Devices

Serial ATA and Parallel ATA drivers

ACPI firmware driver for PATA
 AHCI SATA
 ALi PATA
 AMD/NVidia PATA
 ARTOP 6210/6260 PATA
 ARTOP/Acard ATP867X PATA

VII R-Studio Agent Emergency

R-Studio Agent Emergency is a tool that allows you to start a network computer with a damaged startup disk and recover data stored on its hard drives. Then restored data can be transferred to a working computer via the network.

It works very simple: Just start the computer with the **R-Studio Agent Emergency** startup disk(s) and, if necessary, manually configure a network interface for **R-Studio Agent Emergency**. When started, the computer and its hard drives can be accessed by **R-Studio** installed on another computer on the network.

7.1 Contact Information and Technical Support

To obtain the latest version of **R-Studio Agent Emergency**, go to:

Product Site: <http://www.r-tt.com>

Sales Department: sales@r-tt.com

R-Studio Technical Support Team is available 24 hours a day, seven days a week, and has an average response time less than 4 hours.

Tech. Support: support@r-tt.com

Send your support request to: http://www.r-tt.com/Support_request.html

7.2 Installing R-Studio Agent Emergency Startup Media Creator

You must have administrative privileges to install R-Studio Agent Emergency Startup Media Creator.

If you are not sure whether you have such privileges, you almost certainly do not have them. Contact your system administrator for assistance.

1. Run the setup file.
2. Follow the on-screen instructions.

You may create startup disks even before the installation ends.

7.3 Creating Startup Disks

You need to create either

- A startup CD/DVD disc. You may create an ISO image, or write the disc directly from **R-Studio** Emergency Startup Media Creator, if there is a CD/DVD recorder in your system.

or

- A startup FAT/FAT32 removable device recognized by your system as a bootable one. The total available size of the device should be more than 10 MB.

or

- 4 formatted floppy disks

Check the [Hardware Compatibility List](#).

When **R-Studio Agent Emergency Startup Media Creator** starts, its Welcome dialog box appears:

Welcome to **R-Studio Agent Emergency Startup Media Creator dialog box**

Welcome **dialog box**

click the **Next** button to see the list of all devices on which startup disks may be created.

Startup media type selection **dialog box**

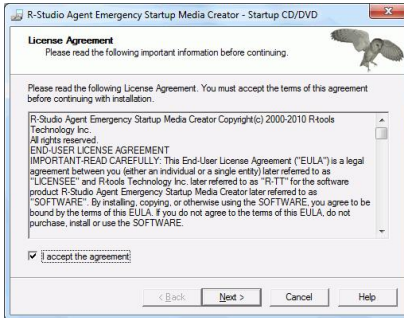

To create a startup CD/DVD disc directly on your CD/DVD writer (if present):

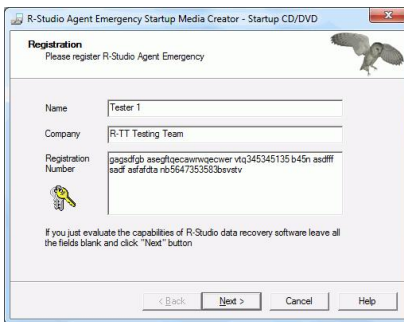

- 1 Run R-Studio Agent Emergency**
- 2 Select the CD/DVD writer on the Startup media type selection dialog box and click the Next button**
- 3 Read and accept the License Agreement and enter the R-Studio Agent registration key on the R-Studio Agent Emergency Activation dialog box and click the Next button**

Note: You should enter the registration key of **R-Studio Agent**, not **R-Studio** itself.

R-Studio Agent Emergency License Agreement dialog box

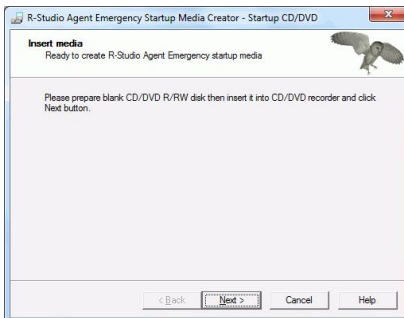

R-Studio Agent Emergency Activation dialog box

if you do not enter the registration key, **R-Studio Agent** Emergency will work in the Demo mode. You may enter the key later when **R-Studio Agent** Emergency and **R-Studio** establish a connection

4 Insert a blank CD/DVD disk into the CD/DVD recorder and click the Next button

Insert media disc dialog box

- > **R-Studio Agent Emergency Startup Media Creator will start creating the startup CD/DVD disc showing the progress on the Creating startup media dialog box**

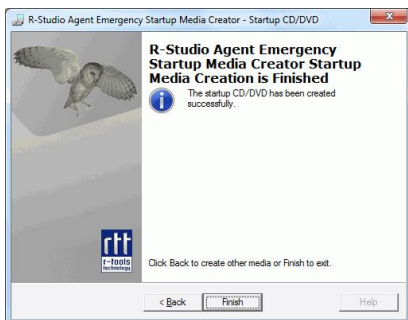

Creating startup media **dialog box**

When **R-Studio Agent Emergency Startup Media Creator finishes creating the startup CD/DVD disc, the R-Studio Agent Emergency Startup Media Creation is Finished message will appear**

You may either exit **R-Studio Emergency Startup Media Creator** by clicking the **Finish** button or create another startup media by clicking the **Back** button.

R-Studio Agent Emergency Startup Media Creation is Finished message

To create an ISO image of a startup CD/DVD disc

- 1 **Run R-Studio Agent Emergency**
- 2 **Select ISO Image for a startup CD/DVD on the R-Studio Agent Emergency Startup Media Creator dialog box and click the Next button**
- 3 **Read and accept the License Agreement and enter the R-Studio Agent registration key on the R-Studio Agent Emergency Activation dialog box and click the Next button**

Note: You should enter the registration key of **R-Studio Agent**, not **R-Studio** itself.

if you do not enter the registration key, **R-Studio Agent** Emergency will work in the Demo mode. You may enter the key later when **R-Studio Agent** Emergency and **R-Studio** establish a connection.

- 4 **Select a place and file name for the ISO image of the startup CD/DVD and click the Save button**
- > **When R-Studio Bootable Startup Media Creator finishes writing the file with the ISO image, the R-Studio Agent Emergency Startup Media Creation is Finished message will appear**

You may either exit **R-Studio Bootable Startup Media Creator** by clicking the **Finish** button or create another startup media by clicking the **Back** button.

R-Studio Agent Emergency Startup Media Creation is Finished dialog box

5 Create the startup CD/DVD using your favorite CD/DVD creation software

Load the created ISO image into the CD/DVD creation software. Consult documentation for the software for details.

To create a startup FAT/FAT32 removable device

1 Run R-Studio Agent Emergency

2 Select the removable device on the Startup media type selection dialog box and click the Next button

3 Read and accept the License Agreement and enter the registration key on the R-Studio Agent Emergency Activation dialog box and click the Next button

4 Check that the correct FAT/FAT32-formatted device is selected and click the Next button

Confirm device selection dialog box

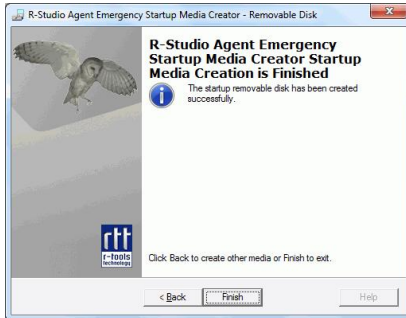

> R-Studio Agent Emergency Startup Media Creator will start creating the startup USB disk showing the progress on the Creating startup media dialog box

When R-Studio Agent Emergency Startup Media Creator finishes creating the startup device, the R-Studio Agent Emergency Startup Media Creation is Finished message will appear

You may either exit R-Studio Emergency Startup Media Creator by clicking the Finish button or create another startup media by clicking the Back button.

R-Studio Agent Emergency Startup Media Creation is Finished dialog box

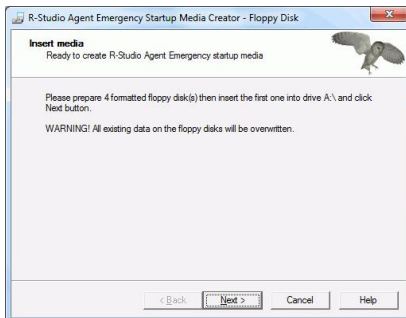

To create floppy disks:

You will need 4 formatted floppy disks.

- 1 **Run R-Studio Agent Emergency**
- 2 **Select Floppy Disk for the startup floppy disk on the R-Studio Agent Emergency Startup Media Creator dialog box and click the Next button**
- 3 **Enter the registration information and number on the Registration dialog box and click the Next button**
If you leave all the field blank, **R-Studio Agent Emergency** will work with the **Demo-version limitations**
- 4 **Insert the floppy disk and click the Next button on the Insert floppy dialog box**

Insert floppy dialog box

- > **R-Studio Agent Emergency Startup Media Creator will start creating the startup floppy disk showing the progress on the Creating startup media dialog box**

Creating startup media dialog box

- 5 Insert the **second floppy disk** and click the **OK** button when the **Please insert formatted diskette #2** into drive A: **message will appear**

Do it with the next 2 floppy disks.

- > **When R-Studio Startup Media Creator finishes creating the startup floppy disk, the R-Studio Agent Emergency Startup Media Creation is Finished message will appear. You may either exit R-Studio Startup Media Creator by clicking the Finish button or create another startup media by clicking the Back button.**

R-Studio Agent Emergency Startup Media Creation is Finished dialog box

7.4 Starting a Computer with the R-Studio Agent Emergency Startup Disk

We recommended that you print out this help page and have the hardcopy on hand while you are performing this action.

Before you start the computer you should be aware that your network has a DHCP server or you know the computer's IP address and network mask.

If there is a non-IDE disk controller in your system, or you plan to use network disks or external hardware devices, first check the [Hardware Compatibility List](#).

If you plan to use any external device, turn it on before starting the system.

If the motherboard in your computer supports the Serial ATA (SATA) devices, but IDE disks are also present, only the SATA devices should be set to the Enhanced Mode in BIOS.

To start the computer with the R-Studio Agent Emergency startup disks

- 1 **Make sure that the first startup device in the system BIOS is the device from which you plan to start your computer (a CD/DVD drive or A (Floppy))**

Disable "Secure boot" in the system BIOS if your computer is certified to run Windows 8. Refer to your system documentation for details. Refer to your system documentation for details.

- 2 **Insert the R-Studio Agent Emergency startup CD/DVD disc, a removable device, or the first floppy disk and start your computer**

- > **R-Studio Agent Emergency will start and its prompt will appear**

If you start your computer with floppy disks, you'll see prompts to insert a next floppy disk.

```
-----
Booting R-Studio Emergency. Please wait...
```

```

Waiting 8 seconds for PCMCIA devices to settle
Booting R-Studio Agent Emergency. Now you may remove floppy.
-----
Querying DHCP to configure network interfaces...
Press ENTER within 10 seconds to configure them manually.

```

If your network has a DHCP server

The computer running R-Studio Agent Emergency will be assigned an IP address automatically

A prompt with a computer address will appear. You need to remember it to access the computer via network.

If your network does not have a DHCP server

You need to configure the interfaces and IP addresses manually.

1. A prompt to select an interface will appear. Enter the selected interface name and press **Enter**.
2. A prompt to enter its IP address and optional subnet mask will appear. Enter the IP address and optional subnet mask and press **Enter**.

```

-----[ List of
Interfaces ]-----
Name          IP Address          NETMASK          Vendor
-----
re0           Unconfigured              RealTek
8139C+
-----
# Enter interface name, 'gw' for default gateway or just press
ENTER to finish
#>re0
# Enter IP address and optional NETMASK delimited by space
#>192.168.0.10 255.255.255.0

```

3. A prompt to configure another interface, gateway, or to finish configuring the interfaces will appear. Enter gw, enter the IP address of the gateway, and press **Enter**.

```

-----[ List of
Interfaces ]-----
Name          IP Address          NETMASK          Vendor
-----
re0           Unconfigured              RealTek
8139C+
-----
# Enter interface name, 'gw' for default gateway or just press
ENTER to finish
#>re0
# Enter IP address and optional NETMASK delimited by space
#>192.168.0.10 255.255.255.0

```

```

-----[ List of
Interfaces ]-----
Name          IP Address          NETMASK          Vendor
-----

```

```

re0          192.168.0.10          255.255.255.0          RealTek
8139C+
gw          Unconfigured          Default
gateway
-----
-----
# Enter interface name, 'gw' for default gateway or just press
ENTER to finish
#>gw
# Enter default gateway IP Address
#>192.168.0.1

-----[ List of
Interfaces ]-----
Name          IP Address          NETMASK          Vendor
-----
re0          192.168.0.10          255.255.255.0          RealTek
8139C+
gw          192.168.0.1          Default
gateway
-----
-----
# Enter interface name, 'gw' for default gateway or just press
ENTER to finish
#>

```

4. Press **Enter** to finish configuring the interfaces, or enter the name of the next interface to configure.

> **R-Studio Agent Emergency will show a prompt that is ready to accept connections**

```

* R-Studio Agent started and ready to accept connections...
* You may press ENTER to start to remote R-Studio...

```

Now the computer may be accessed by **R-Studio** via network.

Secure boot:

It may be impossible to start a Windows 8 certified computer with the R-Studio Agent Emergency startup disk without some additional actions. This happens because any computer should use a so-called "Secure boot" procedure to comply with Windows 8 hardware certification from Microsoft. In brief, this procedure prevents computer from booting into any operating system that isn't digitally signed with an appropriate digital signature. "Secure boot" is claimed to prevent unauthorized modification of the boot sector by bootkits, viruses, trojans, and other malicious software. To the date, only Windows 8, Windows Server 2012, and selected Linux distributions support this feature. As a side effect, it also prevents most LiveCDs, rescue disks (R-Studio and R-Drive Image included), and other OS from running.

Likely enough, the other requirement of Windows 8 hardware certification is to make it possible for the user to disable the Secure boot procedure. Those settings can be done through the system BIOS under the Boot options. Generally, it's enough to enable Legacy support in those options, but sometimes it may require additional actions. Please, refer to your system documentation to learn more about disabling/enabling Secure boot.

When Secure boot is disabled, it should be possible to start the computer with the R-Studio Agent Emergency startup disk.

Please note that you should enable this feature back after using the startup disks because Windows 8 or Server 2012 may not start properly without the Secure boot feature enabled.

Starting a Connection from R-Studio Agent Emergency

When you need to connect **R-Studio** and **R-Studio Agent Emergency** over the Internet, it may be necessary to start the connection from the computer where **R-Studio Agent Emergency** is running.

To connect to **R-Studio's** computer,

- 1 Press the Enter key and enter the IP address of the computer where **R-Studio** is running as `IPaddress:port`.

```
* R-Studio Agent started and ready to accept connections...
* You may press ENTER to start connection to remote R-Studio...
# Enter R-Studio IP address or just press ENTER to cancel>
192.168.0.25:80
```

The default port is 8080, and you don't have to specify it.

- 2 Enter the password if required, and press the Enter key.

```
* R-Studio Agent started and ready to accept connections...
* You may press ENTER to start connection to remote R-Studio...
# Enter R-Studio IP address or just press ENTER to cancel>
192.168.0.25:80
# Enter password or just press ENTER to connect without
one>PaSsWoRd1234
```

- > When the connection is established successfully, **R-Studio Agent Emergency** will notify you about this.

```
* R-Studio Agent started and ready to accept connections...
* You may press ENTER to start connection to remote R-Studio...
# Enter R-Studio IP address or just press ENTER to cancel>
192.168.0.25:80
# Enter password or just press ENTER to connect without
one>PaSsWoRd1234
Connection with 192.168.0.25:80 is established successfully.
```

7.5 R-Studio Agent Emergency Hardware Compatibility List

7.5.1 Disk Controllers

R-Studio Agent Emergency is based on the **FreeBSD 5.3** kernel and supports devices from the list published at <http://www.freebsd.org/releases/5.3R/hardware-i386.html>.

*: Supported in the floppy version

Disk controllers

IDE/ATA controllers (ata driver) *

The adapters supported by the [aic](#) driver include:

- Adaptec AHA-1505 (ISA)
- Adaptec AHA-1510A, AHA-1510B (ISA)
- Adaptec AHA-1520A, AHA-1520B (ISA)
- Adaptec AHA-1522A, AHA-1522B (ISA)
- Adaptec AHA-1535 (ISA)
- Creative Labs SoundBlaster SCSI host adapter (ISA)
- Adaptec AHA-1460, AHA-1460B, AHA-1460C, AHA-1460D (PC Card)
- Adaptec AHA-1030B, AHA-1030P (PC98)
- NEC PC-9801-100 (PC98)

The [aha](#) driver supports the following SCSI host adapters:

- Adaptec AHA-154xB
- Adaptec AHA-154xC
- Adaptec AHA-154xCF
- Adaptec AHA-154xCP
- Adaptec AHA-1640
- Adaptec AHA-174x in 154x emulation mode
- DTC 3290 SCSI controller in 1542 emulation mode
- Tekram SCSI controllers in 154x emulation mode

The [ahb](#) driver supports the following SCSI host adapters:

- Adaptec AHA-1740
- Adaptec AHA-1742
- Adaptec AHA-1740A
- Adaptec AHA-1742A

The [ahc](#) driver supports the following SCSI host adapter chips and SCSI controller cards:

- Adaptec AIC7770 host adapter chip
- Adaptec AIC7850 host adapter chip
- Adaptec AIC7860 host adapter chip
- Adaptec AIC7870 host adapter chip
- Adaptec AIC7880 host adapter chip
- Adaptec AIC7890 host adapter chip
- Adaptec AIC7891 host adapter chip
- Adaptec AIC7892 host adapter chip
- Adaptec AIC7895 host adapter chip
- Adaptec AIC7896 host adapter chip
- Adaptec AIC7897 host adapter chip
- Adaptec AIC7899 host adapter chip
- Adaptec 274X(W)
- Adaptec 274X(T)
- Adaptec 284X
- Adaptec 2910

Adaptec 2915
Adaptec 2920
Adaptec 2930C
Adaptec 2930U2
Adaptec 2940
Adaptec 2940J
Adaptec 2940N
Adaptec 2940U
Adaptec 2940AU
Adaptec 2940UW
Adaptec 2940UW Dual
Adaptec 2940UW Pro
Adaptec 2940U2W
Adaptec 2940U2B
Adaptec 2950U2W
Adaptec 2950U2B
Adaptec 19160B
Adaptec 29160B
Adaptec 29160N
Adaptec 3940
Adaptec 3940U
Adaptec 3940AU
Adaptec 3940UW
Adaptec 3940AUW
Adaptec 3940U2W
Adaptec 3950U2
Adaptec 3960
Adaptec 39160
Adaptec 3985
Adaptec 4944UW
NEC PC-9821Xt13 (PC-98)
NEC RvII26 (PC-98)
NEC PC-9821X-B02L/B09 (PC-98)
NEC SV-98/2-B03 (PC-98)
Many motherboards with on-board SCSI support

The [ahd](#) driver supports the following:

Adaptec AIC7901 host adapter chip
Adaptec AIC7901A host adapter chip
Adaptec AIC7902 host adapter chip
Adaptec 29320 host adapter
Adaptec 39320 host adapter
Many motherboards with on-board SCSI support

Controllers supported by the [aac](#) driver include:

Adaptec AAC-364
Adaptec SCSI RAID 2120S

Adaptec SCSI RAID 2130S
Adaptec SCSI RAID 2200S
Adaptec SCSI RAID 2410SA
Adaptec SCSI RAID 2810SA
Adaptec SCSI RAID 5400S
Dell CERC SATA RAID 2
Dell PERC 2/Si
Dell PERC 2/QC
Dell PERC 3/Si
Dell PERC 3/Di
Dell PERC 320/DC
HP NetRAID 4M

The **adv** driver supports the following SCSI controllers:

AdvanSys ABP510/5150
AdvanSys ABP5140
AdvanSys ABP5142
AdvanSys ABP902/3902
AdvanSys ABP3905
AdvanSys ABP915
AdvanSys ABP920
AdvanSys ABP3922
AdvanSys ABP3925
AdvanSys ABP930, ABP930U, ABP930UA
AdvanSys ABP960, ABP960U
AdvanSys ABP542
AdvanSys ABP742
AdvanSys ABP842
AdvanSys ABP940
AdvanSys ABP940UA/3940UA
AdvanSys ABP940U
AdvanSys ABP3960UA
AdvanSys ABP970, ABP970U
AdvanSys ABP752
AdvanSys ABP852
AdvanSys ABP950
AdvanSys ABP980, ABP980U
AdvanSys ABP980UA/3980UA
MELCO IFC-USP (PC-98)
RATOC REX-PCI30 (PC-98)
@Nifty FNECHARD IFC-USUP-TX (PC-98)

The **adw** driver supports SCSI controllers including:

AdvanSys ABP940UW/ABP3940UW
AdvanSys ABP950UW
AdvanSys ABP970UW
AdvanSys ABP3940U2W

AdvanSys ABP3950U2W

The **bt** driver supports the following BusLogic MultiMaster ``W'', ``C'', ``S'', and ``A'' series and compatible SCSI host adapters:

- BusLogic BT-445C
- BusLogic BT-445S
- BusLogic BT-540CF
- BusLogic BT-542B
- BusLogic BT-542B
- BusLogic BT-542D
- BusLogic BT-545C
- BusLogic BT-545S
- BusLogic/BusTek BT-640
- BusLogic BT-742A
- BusLogic BT-742A
- BusLogic BT-747C
- BusLogic BT-747D
- BusLogic BT-747S
- BusLogic BT-757C
- BusLogic BT-757CD
- BusLogic BT-757D
- BusLogic BT-757S
- BusLogic BT-946C
- BusLogic BT-948
- BusLogic BT-956C
- BusLogic BT-956CD
- BusLogic BT-958
- BusLogic BT-958D
- Storage Dimensions SDC3211B / SDC3211F

AMI FastDisk Host Adapters that are true BusLogic MultiMaster clones are also supported by the **bt** driver.

The **dpt** driver provides support for the following RAID adapters:

- DPT Smart Cache Plus
- Smart Cache II (PM2???, PM2022 [EISA], PM2024/PM2124 [PCI]) (Gen2)
- Smart RAID II (PM3???, PM3021, PM3222)
- Smart Cache III (PM2?3?)
- Smart RAID III (PM3?3?, PM3332 [EISA], PM3334UW [PCI]) (Gen3)
- Smart Cache IV (PM2?4?, PM2042 [EISA], PM2044/PM2144 [PCI]) (Gen4)
- Smart RAID IV

The adapters currently supported by the **asr** driver include the following:

- Adaptec Zero-Channel SCSI RAID 2000S, 2005S, 2010S, 2015S
- Adaptec SCSI RAID 2100S, 2110S
- Adaptec ATA-100 RAID 2400A
- Adaptec SCSI RAID 3200S, 3210S
- Adaptec SCSI RAID 3400S, 3410S
- Adaptec SmartRAID PM1554
- Adaptec SmartRAID PM1564

Adaptec SmartRAID PM2554
Adaptec SmartRAID PM2564
Adaptec SmartRAID PM2664
Adaptec SmartRAID PM2754
Adaptec SmartRAID PM2865
Adaptec SmartRAID PM3754
Adaptec SmartRAID PM3755U2B / SmartRAID V Millennium
Adaptec SmartRAID PM3757
DEC KZPCC-AC (LVD 1-ch, 4MB or 16MB cache), DEC KZPCC-CE (LVD 3-ch, 64MB cache), DEC KZPCC-XC (LVD 1-ch, 16MB cache), DEC KZPCC-XE (LVD 3-ch, 64MB cache) -- rebadged SmartRAID V Millennium

The `amr` driver supports the following:

AMI MegaRAID 320-1
AMI MegaRAID 320-2
AMI MegaRAID 320-4X
AMI MegaRAID Series 418
AMI MegaRAID Enterprise 1200 (Series 428)
AMI MegaRAID Enterprise 1300 (Series 434)
AMI MegaRAID Enterprise 1400 (Series 438)
AMI MegaRAID Enterprise 1500 (Series 467)
AMI MegaRAID Enterprise 1600 (Series 471)
AMI MegaRAID Elite 1500 (Series 467)
AMI MegaRAID Elite 1600 (Series 493)
AMI MegaRAID Elite 1650 (Series 4xx)
AMI MegaRAID Express 100 (Series 466WS)
AMI MegaRAID Express 200 (Series 466)
AMI MegaRAID Express 300 (Series 490)
AMI MegaRAID Express 500 (Series 475)
Dell PERC
Dell PERC 2/SC
Dell PERC 2/DC
Dell PERC 3/DCL
Dell PERC 3/QC
Dell PERC 4/Di
HP NetRAID-1/Si
HP NetRAID-3/Si (D4943A)
HP Embedded NetRAID
Note: Booting from these controllers is supported. EISA adapters are not supported.

Controllers supported by the `mlx` driver include:

Mylex DAC960P
Mylex DAC960PD / DEC KZPSC (Fast Wide)
Mylex DAC960PDU
Mylex DAC960PL
Mylex DAC960PJ
Mylex DAC960PG

Mylex DAC960PU / DEC PZPAC (Ultra Wide)

Mylex AcceleRAID 150 (DAC960PRL)

Mylex AcceleRAID 250 (DAC960PTL1)

Mylex eXtremeRAID 1100 (DAC1164P)

RAIDarray 230 controllers, aka the Ultra-SCSI DEC KZPAC-AA (1-ch, 4MB cache), KZPAC-CA (3-ch, 4MB), KZPAC-CB (3-ch, 8MB cache)

All major firmware revisions (2.x, 3.x, 4.x and 5.x) are supported, however it is always advisable to upgrade to the most recent firmware available for the controller. Compatible Mylex controllers not listed should work, but have not been verified.

Note: Booting from these controllers is supported. EISA adapters are not supported.

Controllers supported by the `mly` driver include:

Mylex AcceleRAID 160

Mylex AcceleRAID 170

Mylex AcceleRAID 352

Mylex eXtremeRAID 2000

Mylex eXtremeRAID 3000

Compatible Mylex controllers not listed should work, but have not been verified.

The `twe` driver supports the following ATA RAID controllers:

AMCC's 3ware 5000 series

AMCC's 3ware 6000 series

AMCC's 3ware 7000-2

AMCC's 3ware 7006-2

AMCC's 3ware 7500-4LP

AMCC's 3ware 7500-8

AMCC's 3ware 7500-12

AMCC's 3ware 7506-4LP

AMCC's 3ware 7506-8

AMCC's 3ware 7506-12

AMCC's 3ware 8006-2LP

AMCC's 3ware 8500-4LP

AMCC's 3ware 8500-8

AMCC's 3ware 8500-12

AMCC's 3ware 8506-4LP

AMCC's 3ware 8506-8

AMCC's 3ware 8506-8MI

AMCC's 3ware 8506-12

AMCC's 3ware 8506-12MI

The `twa` driver supports the following PATA/SATA RAID controllers:

AMCC's 3ware 9500S-4LP

AMCC's 3ware 9500S-8

AMCC's 3ware 9500S-8MI

AMCC's 3ware 9500S-12

AMCC's 3ware 9500S-12MI

The **ncr** driver provides support for the following NCR/Symbios SCSI controller chips:

53C810
53C810A
53C815
53C820
53C825A
53C860
53C875
53C875J
53C885
53C895
53C895A
53C896
53C1510D

The following add-on boards are known to be supported:

I-O DATA SC-98/PCI (PC-98)
I-O DATA SC-PCI (PC-98)

The **sym** driver provides support for the following Symbios/LSI Logic PCI SCSI controllers:

53C810
53C810A
53C815

The SCSI controllers supported by **sym** can be either embedded on a motherboard, or on one of the following add-on boards:

ASUS SC-200, SC-896
Data Technology DTC3130 (all variants)
DawiControl DC2976UW
Diamond FirePort (all)
I-O DATA SC-UPCI (PC-98)
Logitec LHA-521UA (PC-98)
NCR cards (all)

Symbios cards (all)

Tekram DC390W, 390U, 390F, 390U2B, 390U2W, 390U3D, and 390U3W

Tyan S1365

The following devices are currently supported by the `ncv` driver:

I-O DATA PCSC-DV

KME KXLC002 (TAXAN ICD-400PN, etc.), KXLC004, and UJDCD450

Macnica Miracle SCSI-II mPS110

Media Intelligent MSC-110, MSC-200

NEC PC-9801N-J03R

New Media Corporation BASICS SCSI

Qlogic Fast SCSI

RATOC REX-9530, REX-5572 (SCSI only)

Controllers supported by the `stg` driver include:

Adaptec 2920/A

Future Domain SCSI2GO

Future Domain TMC-18XX/3260

IBM SCSI PCMCIA Card

ICM PSC-2401 SCSI

MELCO IFC-SC

RATOC REX-5536, REX-5536AM, REX-5536M, REX-9836A

Note that the Adaptec 2920C is supported by the `ahc` driver.

Cards supported by the `isp` driver include:

ISP1000

PTI SBS440

ISP1020

ISP1040

PTI SBS450

Qlogic 1240

Qlogic 1020

Qlogic 1040

Qlogic 1080

Qlogic 1280

Qlogic 12160

Qlogic 2100

Qlogic 2102

Qlogic 2200

Qlogic 2202

Qlogic 2204

Qlogic 2300

Qlogic 2312

PTI SBS470

Antares P-0033

Controllers supported by the `amd` driver include:

MELCO IFC-DP (PC-98)

Tekram DC390
Tekram DC390T

Controllers supported by the `nsp` driver include:

Alpha-Data AD-PCS201
I-O DATA CBSC16
Adaptec AIC-7110 Parallel to SCSI interfaces (`vpo` driver)

The following controllers are supported by the `ida` driver:

Compaq SMART Array 221
Compaq Integrated SMART Array Controller
Compaq SMART Array 4200
Compaq SMART Array 4250ES
Compaq SMART 3200 Controller
Compaq SMART 3100ES Controller
Compaq SMART-2/DH Controller
Compaq SMART-2/SL Controller
Compaq SMART-2/P Controller
Compaq SMART-2/E Controller
Compaq SMART Controller

Controllers supported by the `ci` driver include:

Compaq Smart Array 5300
Compaq Smart Array 532
Compaq Smart Array 5i
HP Smart Array 5312
HP Smart Array 6i
HP Smart Array 641
HP Smart Array 642
HP Smart Array 6400
HP Smart Array 6400 EM
HP Smart Array 6422
HP Smart Array V100
HP Modular Smart Array 20 (MSA20)
HP Modular Smart Array 500 (MSA500)

Controllers supported by the `iir` driver include:

Intel RAID Controller SRCMR
Intel Server RAID Controller U3-1 (SRCU31a)
Intel Server RAID Controller U3-1L (SRCU31La)
Intel Server RAID Controller U3-2 (SRCU32)
All past and future releases of Intel and ICP RAID Controllers.
Intel RAID Controller SRCU21 (discontinued)
Intel RAID Controller SRCU31 (older revision, not compatible)
Intel RAID Controller SRCU31L (older revision, not compatible)
The SRCU31 and SRCU31L can be updated via a firmware update available from Intel.
Promise SuperTrak ATA RAID controllers (`pst` driver)

The **hptmv** driver supports the HighPoint RocketRAID 182x SATA controllers.

Controllers supported by the **ips** driver include:

- IBM ServeRAID 3H
- ServeRAID 4L/4M/4H
- ServeRAID Series 5
- ServeRAID 6i/6M

The following controllers are supported by the **mpt** driver:

- LSI Logic 53c1030 (Dual Ultra320 SCSI)
- LSI Logic FC909 (1Gb/s Fibre Channel)
- LSI Logic FC909A (Dual 1Gb/s Fibre Channel)
- LSI Logic FC919 (2Gb/s Fibre Channel)
- LSI Logic FC929 (Dual 2Gb/s Fibre Channel)

The SCSI controller chips supported by the **mpt** driver can be found onboard on many systems including:

- Dell PowerEdge 1750
- IBM eServer xSeries 335

SCSI controllers supported by the **trm** driver include:

- Tekram DC-315 PCI Ultra SCSI adapter without BIOS and internal SCSI connector
- Tekram DC-315U PCI Ultra SCSI adapter without BIOS
- Tekram DC-395F PCI Ultra-Wide SCSI adapter with flash BIOS and 68-pin external SCSI connector
- Tekram DC-395U PCI Ultra SCSI adapter with flash BIOS
- Tekram DC-395UW PCI Ultra-Wide SCSI adapter with flash BIOS
- Tekram DC-395U2W PCI Ultra2-Wide SCSI adapter with flash BIOS

For the Tekram DC-310/U and DC-390F/U/UW/U2B/U2W/U3W PCI SCSI host adapters, use the **sym** driver.

The **wds** driver supports the WD7000 SCSI controller.

7.5.2 Network Cards

R-Studio Agent Emergency is based on the **FreeBSD 5.3** kernel and supports devices from the list published at <http://www.freebsd.org/releases/5.3R/hardware-i386.html>.

*: Supported in the floppy version

Ethernet NICs

Adapters supported by the **sf** driver include:

- ANA-62011 64-bit single port 10/100baseTX adapter
- ANA-62022 64-bit dual port 10/100baseTX adapter
- ANA-62044 64-bit quad port 10/100baseTX adapter
- ANA-69011 32-bit single port 10/100baseTX adapter
- ANA-62020 64-bit single port 100baseFX adapter

The **ti** driver supports Gigabit Ethernet adapters based on the Alteon Tigon I and II chips. The **ti** driver has been tested with the following adapters:

- 3Com 3c985-SX Gigabit Ethernet adapter (Tigon 1)
- 3Com 3c985B-SX Gigabit Ethernet adapter (Tigon 2)
- Alteon AceNIC V Gigabit Ethernet adapter (1000baseSX)
- Alteon AceNIC V Gigabit Ethernet adapter (1000baseT)
- Digital EtherWORKS 1000SX PCI Gigabit adapter

Netgear GA620 Gigabit Ethernet adapter (1000baseSX)

Netgear GA620T Gigabit Ethernet adapter (1000baseT)

The following adapters should also be supported but have not yet been tested:

Asante GigaNIX1000T Gigabit Ethernet adapter

Asante PCI 1000BASE-SX Gigabit Ethernet adapter

Farallon PN9000SX Gigabit Ethernet adapter

NEC Gigabit Ethernet

Silicon Graphics PCI Gigabit Ethernet adapter

The `pcn` driver supports adapters and embedded controllers based on the AMD PCnet/FAST, PCnet/FAST+, PCnet/FAST III, PCnet/PRO and PCnet/Home Fast Ethernet chips:

AMD Am53C974/Am79C970/Am79C974 PCnet-PCI *

AMD Am79C970A PCnet-PCI II *

AMD Am79C971 PCnet-FAST *

AMD Am79C972 PCnet-FAST+ *

AMD Am79C973/Am79C975 PCnet-FAST III *

AMD Am79C976 PCnet-PRO *

AMD PCnet/Home HomePNA

Allied-Telesis LA-PCI

Contec C-NET(98)S (PC-98)

NEC SV-98/2-B05, B06

The `lnc` driver supports the following adapters:

Novell NE2100 *

Novell NE32-VL *

Isolan AT 4141-0 (16 bit)

Isolan BICC

Isolink 4110 (8 bit)

Diamond HomeFree

Digital DEPCA

Hewlett Packard Vectra 486/66XM

Hewlett Packard Vectra XU

Also supported are adapters working with the `pcn` driver. The `lnc` driver runs these in compatibility mode, thus the `pcn` driver should be preferred.

SMC 83c17x (EPIC)-based Ethernet NICs (`tx` driver)

The `ed` driver supports the following Ethernet NICs:

3Com 3c503 Etherlink II

AR-P500 Ethernet

Accton EN1644 (old model), EN1646 (old model), EN2203 (old model) (110pin) (flags 0xd00000)

Accton EN2212/EN2216/UE2216

Allied Telesis CentreCOM LA100-PCM_V2

Allied Telesis LA-98 (flags 0x000000) (PC-98)

Allied Telesis SIC-98, SIC-98NOTE (110pin), SIU-98 (flags 0x600000) (PC-98)

Allied Telesis SIU-98-D (flags 0x610000) (PC-98)

AmbiCom 10BaseT card

Netronix Inc. EA-1210 NetEther 10/100
Nortel Networks 10/100BaseTX
OvisLink LEF-8129TX
OvisLink LEF-8139TX
Peppercon AG ROL-F
Planex FNW-3800-TX

SMC EZ Card 10/100 PCI 1211-TX
SOHO(PRAGMATIC) UE-1211C

The **wb** driver supports Winbond W89C840F based Fast Ethernet adapters and embedded controllers including:

Trendware TE100-PCIE *

The **vr** driver supports VIA Technologies Rhine I, Rhine II, and Rhine III based Fast Ethernet adapters including:

D-Link DFE530-TX
Hawking Technologies PN102TX
AOpen/Acer ALN-320

The **sis** driver supports Silicon Integrated Systems SiS 900 * and SiS 7016 * based Fast Ethernet adapters and embedded controllers, as well as Fast Ethernet adapters based on the National Semiconductor DP83815 (MacPhyter) chip. Supported adapters include:

@Nifty FNECHARD IFC USUP-TX
MELCO LGY-PCI-TXC
Netgear FA311-TX (DP83815)
Netgear FA312-TX (DP83815)
SiS 630, 635, and 735 motherboard chipsets

The **nge** driver supports National Semiconductor DP83820 * and DP83821 based Gigabit Ethernet adapters including:

SMC EZ Card 1000 (SMC9462TX)
D-Link DGE-500T
Asante FriendlyNet GigaNIX 1000TA and 1000TPC
Addtron AEG320T
LinkSys EG1032 (32-bit PCI) and EG1064 (64-bit PCI)
Surecom Technology EP-320G-TX
Netgear GA622T
Netgear GA621
Ark PC SOHO-GA2500T (32-bit PCI) and SOHO-GA2000T (64-bit PCI)
Trendware TEG-PCITX (32-bit PCI) and TEG-PCITX2 (64-bit PCI)

The **ste** driver supports Sundance Technologies ST201 based Fast Ethernet adapters and embedded controllers including:

D-Link DFE-530TXS
D-Link DFE-550TX

Adapters supported by the **sk** driver include:

3COM 3C940 single port, 1000baseT adapter
Belkin F5D5005 single port, 1000baseT adapter
Linksys EG1032 single port, 1000baseT adapter
SK-9521 SK-NET GE-T single port, 1000baseT adapter
SK-9821 SK-NET GE-T single port, 1000baseT adapter *
SK-9822 SK-NET GE-T dual port, 1000baseT adapter *
SK-9841 SK-NET GE-LX single port, single mode fiber adapter *
SK-9842 SK-NET GE-LX dual port, single mode fiber adapter *
SK-9843 SK-NET GE-SX single port, multimode fiber adapter *
SK-9844 SK-NET GE-SX dual port, multimode fiber adapter *

SMC 9452TX single port, 1000baseT adapter

The `tl` driver supports Texas Instruments ThunderLAN based Ethernet and Fast Ethernet adapters including a large number of Compaq PCI Ethernet adapters. Also supported are:

Olicom OC-2135/2138 10/100 TX UTP adapter

Olicom OC-2325/OC-2326 10/100 TX UTP adapter

Racore 8148 10baseT/100baseTX/100baseFX adapter

Racore 8165 10/100baseTX adapter

The `tl` driver also supports the built-in Ethernet adapters of various Compaq Prosignia servers and Compaq Deskpro desktop machines including:

Compaq Netelligent 10

Compaq Netelligent 10 T PCI UTP/Coax

Compaq Netelligent 10/100

Compaq Netelligent 10/100 Dual-Port

Compaq Netelligent 10/100 Proliant

Compaq Netelligent 10/100 TX Embedded UTP

Compaq Netelligent 10/100 TX UTP

Compaq NetFlex 3P

Compaq NetFlex 3P Integrated

Compaq NetFlex 3P w/BNC

The `dc` driver provides support for the following chipsets: *

DEC/Intel 21143

ADMtek AL981 Comet, AN985 Centaur, ADM9511 Centaur II and ADM9513 Centaur II

ASIX Electronics AX88140A and AX88141

Conexant LANfinity RS7112 (miniPCI)

Davicom DM9009, DM9100, DM9102 and DM9102A

Lite-On 82c168 and 82c169 PNIC

Lite-On/Macronix 82c115 PNIC II

Macronix 98713, 98713A, 98715, 98715A, 98715AEC-C, 98725, 98727 and 98732

Xircom X3201 (cardbus only)

The following NICs are known to work with the `dc` driver at this time:

3Com OfficeConnect 10/100B (ADMtek AN985 Centaur-P)

Abocom FE2500

Accton EN1217 (98715A)

Accton EN2242 MiniPCI

Adico AE310TX (98715A)

Alfa Inc GFC2204 (ASIX AX88140A)

Built in 10Mbps only Ethernet on Compaq Presario 7900 series desktops (21143, non-MII)

Built in DE500-BA on DEC Alpha workstations (21143, non-MII)

Built in Sun DMFE 10/100 Mbps Ethernet on Sun Netra X1 and Sun Fire V100 (DM9102A, MII)

Built in Ethernet on LinkSys EtherFast 10/100 Instant GigaDrive (DM9102, MII)

CNet Pro110B (ASIX AX88140A)

CNet Pro120A (98715A or 98713A) and CNet Pro120B (98715)

Compex RL100-TX (98713 or 98713A)

D-Link DFE-570TX (21143, MII, quad port)

Digital DE500-BA 10/100 (21143, non-MII)

ELECOM Lanced LD-CBL/TXA (ADMtek AN985)
Hawking CB102 CardBus
IBM EtherJet Cardbus Adapter
Intel PRO/100 Mobile Cardbus (versions that use the X3201 chipset)
Jaton XpressNet (Davicom DM9102)
Kingston KNE100TX (21143, MII)
Kingston KNE110TX (PNIC 82c169)
LinkSys LNE100TX (PNIC 82c168, 82c169)
LinkSys LNE100TX v2.0 (PNIC II 82c115)
LinkSys LNE100TX v4.0/4.1 (ADMtek AN985 Centaur-P)
Matrox FastNIC 10/100 (PNIC 82c168, 82c169)
Melco LGY-PCI-TXL
Microsoft MN-120 10/100 CardBus (ADMtek Centaur-C)
Microsoft MN-130 10/100 PCI (ADMtek Centaur-P)
NDC SOHware SFA110A (98713A)
NDC SOHware SFA110A Rev B4 (98715AEC-C)
NetGear FA310-TX Rev. D1, D2 or D3 (PNIC 82c169)
Netgear FA511
PlaneX FNW-3602-T (ADMtek AN985)
SMC EZ Card 10/100 1233A-TX (ADMtek AN985)
SVEC PN102-TX (98713)
Xircom Cardbus Realport
Xircom Cardbus Ethernet 10/100
Xircom Cardbus Ethernet II 10/100

Adapters supported by the [aue](#) driver include:

Abocom UFE1000, DSB650TX_NA
Accton USB320-EC, SpeedStream
ADMtek AN986, AN8511
Billionton USB100, USB100LP, USB100EL, USBE100
Corega Ether FEther USB-T, FEther USB-TX, FEther USB-TXS
D-Link DSB-650, DSB-650TX, DSB-650TX-PNA
Elecom LD-USBL/TX
Elsa Microlink USB2Ethernet
HP hn210e
I-O Data USB ETTX
Kingston KNU101TX
LinkSys USB10T adapters that contain the AN986 Pegasus chipset, USB10TA, USB10TX, USB100TX, USB100H1
MELCO LUA-TX, LUA2-TX
Planex UE-200TX
Sandberg USB to Network Link (model number 133-06)
Siemens Speedstream
SmartBridges smartNIC
SMC 2202USB
SOHware NUB100

The **cue** driver supports CATC USB-EL1210A based USB Ethernet adapters including:

- Belkin F5U011/F5U111
- CATC Netmate
- CATC Netmate II
- SmartBridges SmartLink

The **kue** driver supports Kawasaki LSI KL5KLUSB101B based USB Ethernet adapters including:

- 3Com 3c19250
- 3Com 3c460 HomeConnect Ethernet USB Adapter
- ADS Technologies USB-10BT
- AOX USB101
- ATen UC10T
- Abocom URE 450
- Corega USB-T
- D-Link DSB-650C
- Entrega NET-USB-E45, NET-HUB-3U1E
- I/O Data USB ETT
- Kawasaki DU-H3E
- LinkSys USB10T
- Netgear EA101
- Peracom USB Ethernet Adapter
- SMC 2102USB, 2104USB

The **axe** driver supports ASIX Electronics AX88172 based USB Ethernet adapters including:

- Buffalo (Melco Inc.) LUA-U2-KTX
- D-Link DUBE100
- LinkSys USB200M
- Netgear FA120
- System TALKS Inc. SGC-X2UL

The **rue** driver supports RealTek RTL8150 based USB Ethernet adapters including:

- Buffalo (Melco Inc.) LUA-KTX
- Green House GH-USB100B
- LinkSys USB100M
- Billionton 10/100 FastEthernet USBKR2

The **udav** driver supports the following adapters:

- Corega FEther USB-TXC

Adapters supported by the **de** driver include:

- Adaptec ANA-6944/TX
- Cogent EM100FX and EM440TX
- Corega FastEther PCI-TX
- D-Link DFE-500TX
- DEC DE435, DE425, DEC DE450, and DEC DE500
- ELECOM LD-PCI2T, LD-PCITS
- I-O DATA LA2/T-PCI
- SMC Etherpower 8432, 9332 and 9334
- ZNYX ZX3xx

Controllers and cards supported by the [fe](#) driver include:

Allied Telesis RE1000, RE1000Plus, ME1500 (110-pin)
CONTEC C-NET(98)P2, C-NET (9N)E (110-pin), C-NET(9N)C (ExtCard)
CONTEC C-NET(PC)C PCMCIA Ethernet
Eiger Labs EPX-10BT
Fujitsu FMV-J182, FMV-J182A
Fujitsu MB86960A, MB86965A
Fujitsu MBH10303, MBH10302 Ethernet PCMCIA
Fujitsu Towa LA501 Ethernet
HITACHI HT-4840-11
NextCom J Link NC5310
RATOC REX-5588, REX-9822, REX-4886, and REX-R280
RATOC REX-9880/9881/9882/9883
TDK LAC-98012, LAC-98013, LAC-98025, LAC-9N011 (110-pin)
TDK LAK-CD021, LAK-CD021A, LAK-CD021BX
Ungermann-Bass Access/PC N98C+(PC85152, PC85142), Access/NOTE N98(PC86132) (110-pin)

Adapters supported by the [fxp](#) driver include:

Intel EtherExpress PRO/10
Intel InBusiness 10/100
Intel PRO/100B / EtherExpressPRO/100 B PCI Adapter *
Intel PRO/100+ Management Adapter
Intel PRO/100 VE Desktop Adapter
Intel PRO/100 M Desktop Adapter
Intel PRO/100 S Desktop, Server and Dual-Port Server Adapters
Contec C-NET(PI)-100TX (PC-98)
NEC PC-9821Ra20, Rv20, Xv13, Xv20 internal 100Base-TX (PC-98)
NEC PC-9821X-B06 (PC-98)
Many on-board network interfaces on Intel motherboards

The [ex](#) driver supports the following Ethernet adapters:

Intel EtherExpress Pro/10
Intel EtherExpress Pro/10+
The Olicom OC2220

The [ie](#) driver provides supports the following 8 and 16bit ISA Ethernet cards that are based on the Intel i82586 chip:

3COM 3C507
AT&T EN100
AT&T Starlan 10
AT&T Starlan Fiber
Intel EtherExpress 16
RACAL Interlan NI5210

The [ep](#) driver supports Ethernet adapters based on the 3Com 3C5x9 Etherlink III Parallel Tasking chipset, including:

3Com 3C1 CF
3Com 3C509-TP, 3C509-BNC, 3C509-Combo, 3C509-TPO, 3C509-TPC ISA

3Com 3C509B-TP, 3C509B-BNC, 3C509B-Combo, 3C509B-TPO, 3C509B-TPC ISA
3Com 3C529, 3C529-TP MCA
3Com 3C562/3C563 PCMCIA
3Com 3C569B-J-TPO, 3C569B-J-COMBO CBUS
3Com 3C574-TX, 3CCFE574BT, 3CXFE574BT, 3C3FE574BT PCMCIA
3Com 3C579-TP, 3C579-BNC EISA
3Com 3C589, 3C589B, 3C589C, 3C589D, 3CXE589DT PCMCIA
3Com 3CCFEM556B, 3CCFEM556BI PCMCIA
3Com 3CXE589EC, 3CCE589EC, 3CXE589ET, 3CCE589ET PCMCIA
3Com Megahertz 3CCEM556, 3CXEM556, 3CCEM556B, 3CXEM556B PCMCIA
3Com OfficeConnect 3CXSH572BT, 3CCSH572BT PCMCIA
Farallon EtherMac PCMCIA

The **el** driver supports the 3Com 3c501 8bit ISA Ethernet card.

The **xl** driver supports the following hardware:

3Com 3c900-TPO *
3Com 3c900-COMBO *
3Com 3c905-TX *
3Com 3c905-T4 *
3Com 3c900B-TPO *
3Com 3c900B-TPC *
3Com 3c900B-FL *
3Com 3c900B-COMBO *
3Com 3c905B-T4 *
3Com 3c905B-TX *
3Com 3c905B-FX *
3Com 3c905B-COMBO *
3Com 3c905C-TX *
3Com 3c980, 3c980B, and 3c980C server adapters
3Com 3cSOHO100-TX OfficeConnect adapters
3Com 3c450 HomeConnect adapters
3Com 3c555, 3c556 and 3c556B mini-PCI adapters
3Com 3C3SH573BT, 3C575TX, 3CCFE575BT, 3CXFE575BT, 3CCFE575CT, 3CXFE575CT,
3CCFEM656, 3CCFEM656B, and 3CCFEM656C, 3CXFEM656, 3CXFEM656B, and 3CXFEM656C
CardBus adapters
3Com 3c905-TX, 3c905B-TX 3c905C-TX, and 3c920B-EMB embedded adapters

Both the 3C656 family of CardBus cards and the 3C556 family of MiniPCI cards have a built-in proprietary modem. Neither the xl driver nor any other driver supports this modem.

The **vx** driver supports the following cards:

3Com 3c590 EtherLink III PCI *
3Com 3c592 EtherLink III EISA
3Com 3c595 Fast EtherLink III PCI in 10 Mbps mode *
3Com 3c597 Fast EtherLink III EISA in 10 Mbps mode
Crystal Semiconductor CS89x0-based NICs (**cs** driver)

The [sn](#) driver supports SMC9xxx based ISA and PCMCIA cards including:

3Com Megahertz X-Jack Ethernet PC-Card CC-10BT

The [xe](#) driver supports the following cards:

Xircom CreditCard Ethernet (PS-CE2-10)
Xircom CreditCard Ethernet + Modem 28 (PS-CEM-28)
Xircom CreditCard Ethernet + Modem 33 (CEM33)
Xircom CreditCard 10/100 (CE3, CE3B)
Xircom CreditCard Ethernet 10/100 + Modem 56 (CEM56)
Xircom RealPort Ethernet 10 (RE10)
Xircom RealPort Ethernet 10/100 (RE100)
Xircom RealPort Ethernet 10/100 + Modem 56 (REM56, REM56G)
Accton Fast EtherCard-16 (EN2226)
Compaq Netelligent 10/100 PC Card (CPQ-10/100)
Intel EtherExpress Pro/100 PC Card Mobile Adapter 16 (Pro/100 M16A)
Other similar devices using the same hardware may also be supported.

Adapters supported by the [lge](#) driver include:

SMC TigerCard 1000 (SMC9462SX) *
D-Link DGE-500SX *

The [txp](#) driver supports the following cards:

3Com 3CR990-TX-95 *
3Com 3CR990-TX-97 *
3Com 3cR990B-TXM *
3Com 3CR990SVR95 *
3Com 3CR990SVR97 *
3Com 3cR990B-SRV *

The [bge](#) driver provides support for various NICs based on the Broadcom BCM570x family of Gigabit Ethernet controller chips, including the following:

3Com 3c996-T (10/100/1000baseTX) *
Dell PowerEdge 1750 integrated BCM5704C NIC (10/100/1000baseTX) *
Dell PowerEdge 2550 integrated BCM5700 NIC (10/100/1000baseTX) *
Dell PowerEdge 2650 integrated BCM5703 NIC (10/100/1000baseTX) *
IBM x235 server integrated BCM5703x NIC (10/100/1000baseTX) *
HP ProLiant NC7760 embedded Gigabit NIC (10/100/1000baseTX) *
HP ProLiant NC7770 PCI-X Gigabit NIC (10/100/1000baseTX) *
HP ProLiant NC7781 embedded PCI-X Gigabit NIC (10/100/1000baseTX) *
Netgear GA302T (10/100/1000baseTX) *
SysKonnnect SK-9D21 (10/100/1000baseTX) *
SysKonnnect SK-9D41 (1000baseSX) *

The [em](#) driver supports Gigabit Ethernet adapters based on the Intel 82540, 82541PI, 82542, 82543, 82544, 82546, 82546EB and 82547 controller chips:

Intel PRO/1000 CT Network Connection (82547)
Intel PRO/1000 F Server Adapter (82543)
Intel PRO/1000 Gigabit Server Adapter (82542)*
Intel PRO/1000 GT Desktop Adapter (82541PI)

Intel PRO/1000 MF Dual Port Server Adapter (82546)
Intel PRO/1000 MF Server Adapter (82545)
Intel PRO/1000 MF Server Adapter (LX) (82545)
Intel PRO/1000 MT Desktop Adapter (82540)
Intel PRO/1000 MT Desktop Adapter (82541)
Intel PRO/1000 MT Dual Port Server Adapter (82546)
Intel PRO/1000 MT Quad Port Server Adapter (82546EB)
Intel PRO/1000 MT Server Adapter (82545)
Intel PRO/1000 T Desktop Adapter (82544)
Intel PRO/1000 T Server Adapter (82543)
Intel PRO/1000 XF Server Adapter (82544)
Intel PRO/1000 XT Server Adapter (82544)

The [gx](#) driver supports Gigabit Ethernet adapters based on the Intel 82542 and 82543 controller chips:

Intel PRO/1000 Gigabit Server Adapter (82542)
Intel PRO/1000 F Server Adapter (82543)
Intel PRO/1000 T Server Adapter (82543)

The [hme](#) driver supports the on-board Ethernet interfaces of many Sun UltraSPARC workstation and server models. Cards supported by the [hme](#) driver include:

Sun PCI SunSwift Adapter
Sun SBus SunSwift Adapter `` (hme" and ``SUNW,hme")
Sun PCI Sun100BaseT Adapter 2.0
Sun SBus Sun100BaseT 2.0
Sun PCI Quad FastEthernet Controller
Sun SBus Quad FastEthernet Controller

The [my](#) driver provides support for various NICs based on the Myson chipset. Supported models include:

Myson MTD800 PCI Fast Ethernet chip
Myson MTD803 PCI Fast Ethernet chip
Myson MTD89X PCI Gigabit Ethernet chip

Broadcom BCM4401 based Fast Ethernet adapters ([bfe](#) driver) *

The [re](#) driver supports RealTek RTL8139C+, RTL8169, RTL8169S and RTL8110S based Fast Ethernet and Gigabit Ethernet adapters including:

Alloy Computer Products EtherGOLD 1439E 10/100 (8139C+) *
Compaq Evo N1015v Integrated Ethernet (8139C+) *
Corega CG-LAPCIGT Gigabit Ethernet (8169S) *
Gigabyte 7N400 Pro2 Integrated Gigabit Ethernet (8110S) *
PLANEX COMMUNICATIONS Inc. GN-1200TC (8169S) *
Xterasys XN-152 10/100/1000 NIC (8169) *

The [ixgb](#) driver supports the following cards:

Intel PRO/10GbE LR Server Adapter *
Intel PRO/10GbE SR Server Adapter *
